Introduction

Overview

This manual describes how to monitor Aliyun cloud services using the Dynamic Applications in the *Alibaba Cloud: Aliyun PowerPack*.

NOTE: ScienceLogic provides this documentation for the convenience of ScienceLogic customers. Some of the configuration information contained herein pertains to third-party vendor software that is subject to change without notice to ScienceLogic. ScienceLogic makes every attempt to maintain accurate technical information and cannot be held responsible for defects or changes in third-party vendor software. There is no written or implied guarantee that information contained herein will work for all third-party variants. See the End User License Agreement (EULA) for more information.

What Does the Alibaba Cloud: Aliyun PowerPack Monitor?

Aliyun, also known as AliCloud, is Alibaba's cloud computing service platform. To monitor Aliyun cloud services using the ScienceLogic platform, you must install the *Alibaba Cloud: Aliyun PowerPack*. This PowerPack enables you to discover, model, and collect data about Aliyun cloud resources.

The *Alibaba Cloud: Aliyun PowerPack* includes:

- An example credential you can use to create SOAP/XML credentials to connect to the Aliyun service
- Dynamic Applications to discover and monitor Aliyun cloud resources
- Device Classes for each type of Aliyun component device monitored by the ScienceLogic platform

The Dynamic Applications in the *Alibaba Cloud: Aliyun PowerPack* can monitor performance metrics and/or collect configuration data for the following Aliyun services and components:

- CloudDisk
- Elastic Compute Service (ECS)

What are Aliyun Regions and Zones?

An Aliyun **region** is an individual data center located in a specific geographic locale. Regions have a canonical naming scheme of:

[country/continent] [direction] [number]

For example, the "US East 1" region is located in the United States, on the East Coast, and it is the #1 data center in that region.

Aliyun regions are also commonly referred to by the city, state, or country in which the data center is located. For example, "China North 2" is commonly referred to as "Beijing", "Asia Pacific SE 2" is commonly referred to as "Sydney", etc.

The Dynamic Applications in the *Alibaba Cloud: Aliyun PowerPack* create a "region" component device for each discovered region. The component devices for regions include both the region name and city/state description.

All instances of an Aliyun service within a specific region then reside in one or more zones. A **zone** is an independent infrastructure set within a regional data center. Some regions have multiple zones, while others have only a single zone.

The Aliyun naming convention for a zone is:

region[a-z]

For example, zone "a" for the region "us-east-1" is named "us-east-1a".

The Dynamic Applications in the *Alibaba Cloud: Aliyun PowerPack* create a "zone" component device for each discovered zone.

Component devices that represent Aliyun services reside under the appropriate "region" and "zone" component devices.

Dynamic Applications: Naming Scheme and Roles

The Dynamic Applications in the *Alibaba Cloud: Aliyun PowerPack* include three types:

- **Discovery.** These Dynamic Applications poll Aliyun for new instances of services or changes to existing instances of services.
- **Configuration.** These Dynamic Applications retrieve configuration information about each service instance

and retrieve any changes to that configuration information.

- **Performance.** These Dynamic Applications poll Aliyun for performance metrics.

Discovery Dynamic Applications are responsible for searching the Aliyun cloud for instances of specific services. Typically, a Discovery Dynamic Application will then align Performance Dynamic Applications and Configuration Dynamic Applications for each discovered service instance.

The general Dynamic Application hierarchy is:

- Account Configuration
 - Region Discovery
 - Zone Discovery
 - Service Discovery
 - Instance Discovery
 - Instance Config
 - Instance Performance

Installing the Alibaba Cloud: Aliyun PowerPack

Before completing the steps in this manual, you must import and install version 100 of the *Alibaba Cloud: Aliyun PowerPack*.

NOTE: To install version 100 of the *Alibaba Cloud: Aliyun PowerPack*, your ScienceLogic system must be upgraded to the 8.2.0 or later release.

To download and install a PowerPack:

TIP: By default, installing a new version of a PowerPack will overwrite all content in that PowerPack that has already been installed on the target system. You can use the **Enable Selective PowerPack Field Protection** setting in the **Behavior Settings** page (System > Settings > Behavior) to prevent local changes for some commonly customized fields from being overwritten. (For more information, see the **System Administration** manual.)

1. Download the PowerPack from the [ScienceLogic Customer Portal](#).
2. Go to the **PowerPack Manager** page (System > Manage > PowerPacks).
3. In the **PowerPack Manager** page, click the **[Actions]** button, then select *Import PowerPack*.

4. The **Import PowerPack** dialog box appears:

5. Click the **[Browse]** button and navigate to the PowerPack file.
6. When the **PowerPack Installer** modal page appears, click the **[Install]** button to install the PowerPack.

NOTE: If you exit the **PowerPack Installer** modal page without installing the imported PowerPack, the imported PowerPack will not appear in the **PowerPack Manager** page. However, the imported PowerPack will appear in the **Imported PowerPacks** modal page. This page appears when you click the **[Actions]** menu and select *Install PowerPack*.

Configuring Aliyun Monitoring

Overview

The following sections describe the steps required to discover Alibaba Aliyun services and component devices in the ScienceLogic platform:

- [Creating a SOAP/XML Credential for Aliyun](#)
- [Creating an Aliyun Virtual Device](#)
- [Discovering Aliyun Component Devices](#)
- [Viewing Aliyun Component Devices](#)

NOTE: To complete the steps in this chapter, you must have the account access key ID and password for the Aliyun service you want to monitor.

Creating a SOAP/XML Credential for Aliyun

To configure the ScienceLogic platform to monitor Aliyun, you must first create a SOAP/XML credential. This credential allows the platform (specifically, the Dynamic Applications in the *Alibaba Cloud: Aliyun PowerPack*) to connect with the Aliyun service. An example SOAP/XML credential that you can edit for your own use is included in the *Alibaba Cloud: Aliyun PowerPack*.

To configure a SOAP/XML credential to access Aliyun:

1. Go to the **Credential Management** page (System > Manage > Credentials).
2. Locate the sample credential included in the *Alibaba Cloud: Aliyun PowerPack*, called **Alibaba Cloud: Aliyun Credential**, then click its wrench icon ().

3. Enter values in the following fields:

- **Profile Name**. Enter a new name for the Aliyun credential.
- **Content Encoding**. Select *text/xml*.
- **Method**. Select POST.
- **HTTP Version**. Select HTTP/1.1.
- **URL**. Keep the default value.

NOTE: The Aliyun service does not require a specific URL to access the service, but the ScienceLogic platform does require a URL value when creating SOAP/XML credentials. Therefore, the **URL** field must have an entry but the value itself does not matter.

- **HTTP Auth User**. Enter the account access key ID for the Aliyun service.
- **HTTP Auth Password**. Enter account access key password for the Aliyun service.

4. Click **[Save As]**.
5. In the confirmation message, click **[OK]**.

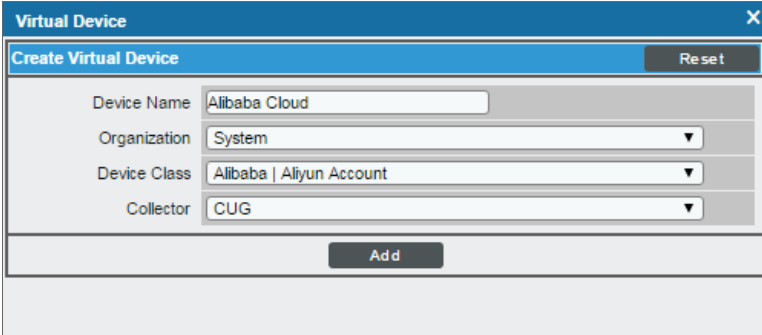

Creating an Aliyun Virtual Device

Because the Aliyun service does not have a static IP address, you cannot discover an Aliyun device using discovery. Instead, you must create a **virtual device** that represents the Aliyun service. A virtual device is a user-defined container that represents a device or service that cannot be discovered by the ScienceLogic platform. You can use the virtual device to store information gathered by policies or Dynamic Applications.

TIP: If you have multiple Aliyun subscriptions you want to monitor, you should create a separate credential and virtual root device for each.

To create a virtual device that represents your Aliyun service:

1. Go to the **Device Manager** page (Registry > Devices > Device Manager).
2. Click **[Actions]** and select *Create Virtual Device* from the menu. The **Virtual Device** modal page appears.
3. Enter values in the following fields:

The screenshot shows a modal window titled "Virtual Device" with a close button (X) in the top right corner. Inside the modal, there is a sub-header "Create Virtual Device" and a "Reset" button. The form contains four fields: "Device Name" with the text "Alibaba Cloud", "Organization" with a dropdown menu showing "System", "Device Class" with a dropdown menu showing "Alibaba | Aliyun Account", and "Collector" with a dropdown menu showing "CUG". At the bottom of the form is an "Add" button.

- **Device Name.** Enter a name for the device. For example, you could enter "Alibaba Cloud" in this field.
- **Organization.** Select the organization for this device. The organization you associate with the device limits the users that will be able to view and edit the device. Typically, only members of the organization will be able to view and edit the device.
- **Device Class.** Select *Alibaba | Aliyun Account*.
- **Collector.** Select the collector group that will monitor the device.

4. Click **[Add]** to create the virtual device.

Discovering Aliyun Component Devices

To discover all of the components of your Aliyun service, you must manually align the *Aliyun Account Configuration* and *Aliyun Region Discovery* Dynamic Applications with the Aliyun virtual device. To do so, perform the following steps:

1. Go to the **Device Manager** page (Registry > Devices > Device Manager).
2. Click the wrench icon (🔧) for your Aliyun virtual device.
3. In the **Device Administration** panel, click the **[Collections]** tab. The **Dynamic Application Collections** page appears.
4. Click **[Actions]** and select *Add Dynamic Application* from the menu.

5. In the **Dynamic Application Alignment** modal page:

- In the **Dynamic Applications** field, select the *Aliyun Account Configuration* Dynamic Application.
- In the **Credentials** field, select the [credential you created for your Aliyun service](#).

6. Click **[Save]** to align the Dynamic Application with the Aliyun virtual device.

7. Repeat steps 4-6 to align the *Aliyun Region Discovery* Dynamic Application with the Aliyun virtual device.

When you align the *Aliyun Account Configuration* Dynamic Application with the Aliyun virtual device, the Dynamic Application creates a component device representing the Aliyun account.

When you align the *Aliyun Region Discovery* Dynamic Application to the account component device, the Dynamic Application determines the regions used by the Aliyun account and creates a component device for each region.

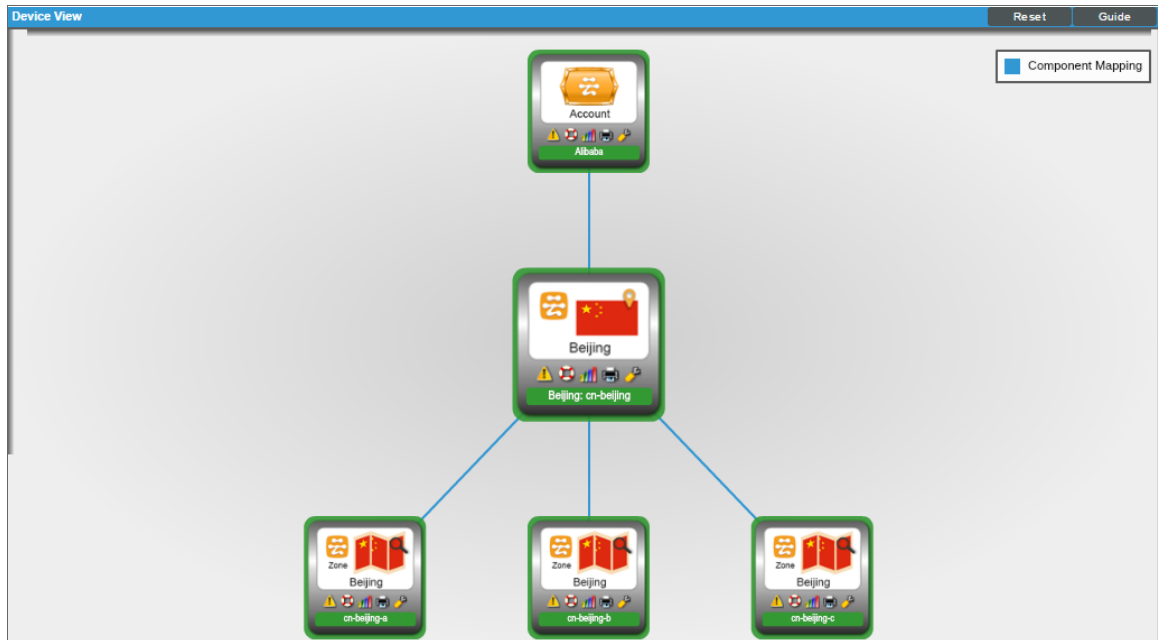

Under each region, the ScienceLogic platform then discovers the following component device categories:

- Availability Zones
 - CloudDisk services
 - CloudDisk instances
 - Elastic Compute Service (ECS) services
 - ECS instances

Viewing Aliyun Component Devices

In addition to the **Device Manager** page (Registry > Devices > Device Manager), you can view the Aliyun service and all associated component devices in the following places in the user interface:

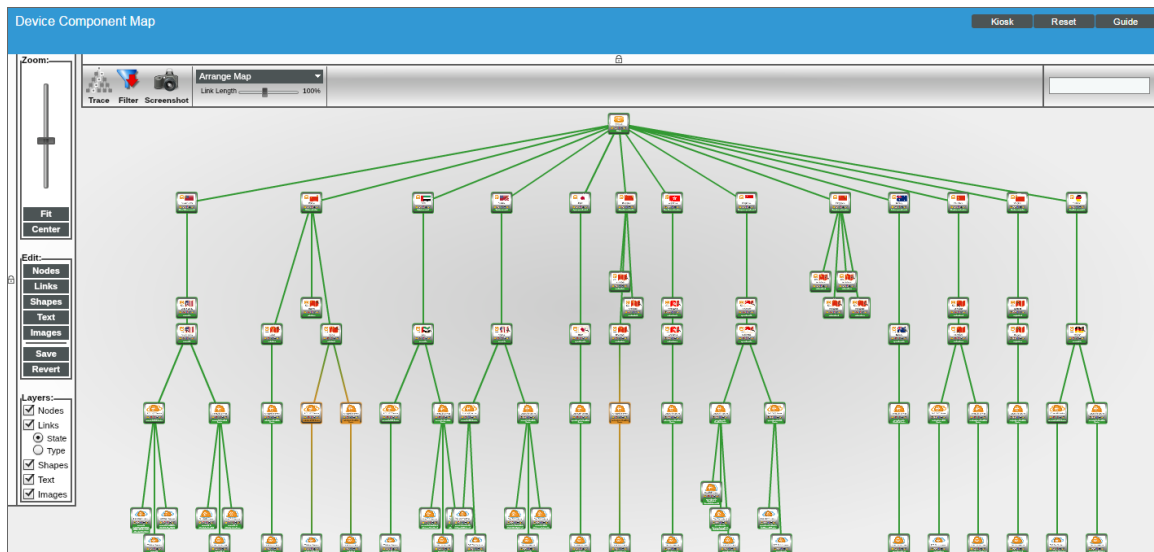

- The **Device View** modal page (Registry > Devices > Device Manager > graph icon > Topology) displays a map of a particular device and all of the devices with which it has parent-child relationships. Double-clicking any of the devices listed reloads the page with the selected device as the primary device:

- The **Device Components** page (Registry > Devices > Device Components) displays a list of all root devices and component devices discovered by the ScienceLogic platform in an indented view, so you can easily view the hierarchy and relationships between child devices, parent devices, and root devices. To view the component devices associated with the Aliyun service, find the Aliyun virtual device and click its plus icon (+):

Device Name	IP Address	Device Category	Device Class Sub-class	IID	Organization	Current State	Collection Group	Collection State
1. - Alibaba	--	Service	Alibaba Aliyun Account	954	System	Healthy	CUG	Active
1. - Beijing: cn-beijing	--	Region	Alibaba Aliyun China North 2 (Beijing)	956	System	Healthy	CUG	Active
1. + cn-beijing-a	--	AvailabilityZone	Alibaba Aliyun Zone - China North 2	968	System	Healthy	CUG	Active
2. - cn-beijing-b	--	AvailabilityZone	Alibaba Aliyun Zone - China North 2	970	System	Healthy	CUG	Active
1. - cn-beijing-b CloudDisk Service	--	Service	Alibaba Aliyun CloudDisk Service	995	System	Major	CUG	Unavailable
1. cn-beijing-b d-2zeiml84yep9wrs5	--	Storage	Alibaba Aliyun CloudDisk Instance	1015	System	Healthy	CUG	Unavailable
2. - cn-beijing-b ECS Service	--	Service	Alibaba Aliyun ECS Service	994	System	Major	CUG	Unavailable
1. cn-beijing-b Win-2012-12ze7q996	--	Compute	Alibaba Aliyun ECS Instance	1014	System	Healthy	CUG	Unavailable
3. cn-beijing-c	--	AvailabilityZone	Alibaba Aliyun Zone - China North 2	969	System	Healthy	CUG	Active

- The **Component Map** page (Views > Device Maps > Components) allows you to view devices by root node and view a map of the relationships between root nodes, parent components, and child components. This makes it easy to visualize and manage root nodes and their components. The ScienceLogic platform automatically updates the **Component Map** as new component devices are discovered. The platform also updates each map with the latest status and event information. To view the map for the Aliyun service, go to the **Component Map** page and select the map from the list in the left NavBar. To learn more about the **Component Map** page, see the **Views** manual.
