Chapter 1

Introduction

Overview

This manual describes how to monitor Amazon Web Services (AWS) in SL1 using the *Amazon Web Services PowerPack*. It also describes the reports you can generate and the dashboards you can view after you collect data from AWS, as well as the Run Book Action and Automation policies you can use to automate certain aspects of monitoring AWS.

Use the following menu options to navigate the SL1 user interface:

- To view a pop-out list of menu options, click the menu icon ().
- To view a page containing all the menu options, click the Advanced menu icon (.

The following sections provide an overview of Amazon Web Services and the *Amazon Web Services PowerPack*:

<i>What is AWS?</i>	5
<i>What is an AWS Region?</i>	5
<i>What is an AWS Zone?</i>	6
<i>What Does the Amazon Web Services PowerPack Monitor?</i>	6
<i>Installing the Amazon Web Services PowerPack</i>	9
<i>Monitoring Consolidated Billing Accounts</i>	10
<i>ScienceLogic Events and AWS Alarms</i>	10

NOTE: For more information about setting up a SL1 appliance on an Amazon Web Services EC2 instance, see the <i>Installation and Initial Configuration</i> manual.

NOTE: For more information about setting up an AWS Elasticsearch, Logstash, and Kibana (ELK) stack, see the *Monitoring AWS ELK Stacks* manual.

NOTE: ScienceLogic provides this documentation for the convenience of ScienceLogic customers. Some of the configuration information contained herein pertains to third-party vendor software that is subject to change without notice to ScienceLogic. ScienceLogic makes every attempt to maintain accurate technical information and cannot be held responsible for defects or changes in third-party vendor software. There is no written or implied guarantee that information contained herein will work for all third-party variants. See the End User License Agreement (EULA) for more information.

What is AWS?

Amazon Web Services is Amazon's "Infrastructure as a Service" offering. AWS includes multiple products (called **Services**) including compute, DNS, networking, content delivery, analytics, storage, and database services, among many others.

What is an AWS Region?

An AWS region is an individual data center located in a specific geographic locale. Regions have a canonical naming scheme of:

country/continent-direction-number

For example, the 'us-east-1' region is located in the United States, on the east coast, and it is the #1 data center in that region.

AWS regions are also commonly referred to by the city or state in which the data center is located. For example, us-west-2 is commonly referred to as "Oregon", ap-northeast-1 is commonly referred to as "Tokyo", etc.

The Dynamic Applications in the *Amazon Web Services PowerPack* create a "region" component device for each discovered region. The component devices for regions include both the region name and city/state description. For example, the Dynamic Applications might discover a component device called "Oregon: us-west-2". Component devices that represent region-specific AWS services reside under the appropriate "region" component device and appropriate "zone" component device.

NOTE: For more information about AWS regions, see https://docs.amazonaws.cn/en_us/general/latest/gr/rande.html.

What is an AWS Zone?

All instances of an AWS service reside in one or more Zones. A zone is a physical network and power partition (air-gap firewall) within a regional data center. Some AWS instances, like EC2 instances, are in a single zone. Other AWS instances, like an SNS queue, exist in all zones simultaneously.

The AWS naming convention for a zone is:

region[a-z]

For example, zone 'a' for the region 'us-east-1' is named 'us-east-1a'.

When a user deploys a service instance, the user can specify a "zone preference", but the final zone for that service instance is decided by AWS, not the user.

The Dynamic Applications in the *Amazon Web Services PowerPack* create a "zone" component device for each discovered zone.

AWS services with a specific zone affinity reside under the appropriate zone component device. For example, the Dynamic Applications in the PowerPack might discover the zone "us-west-1b" and create a component device called "us-west-1b".

AWS services that are specific to a zone reside under the appropriate "region" component device and appropriate "zone" component device. The Dynamic Applications in the PowerPack create a "multi-zoned" component device for services that are inherently zone agnostic such as the Simple Queue Service (SQS).

Component devices that represent Zones are a named container with no associated performance metrics.

What Does the Amazon Web Services PowerPack Monitor?

To collect data from Amazon Web Services, the ScienceLogic Data Collector or All-In-One Appliance connects via HTTPS to the URLs listed in the following AWS document:

<http://docs.aws.amazon.com/general/latest/gr/rande.html>.

The *Amazon Web Services PowerPack* includes Dynamic Applications that can monitor performance metrics and collect configuration data for the following AWS Services and components:

- API Gateways
- AutoScale
- CloudFront
- CloudTrail
- CloudWatch
- Direct Connect
- DynamoDB (DDB)

- ElastiCache
- Elastic Beanstalk
- Elastic Block Store (EBS)
- Elastic Compute Cloud (EC2)
- Elastic Container Services (ECS)
- Elastic File System (EFS)
- Elastic Kubernetes Service (EKS)
- Elastic Load Balancers (ELB)
- Elastic Map Reduce (EMR)
- Glacier
- IoT
- Key Management Service (KMS)
- Lambda
- Lightsail
- OpsWorks
- RedShift
- Relational Data Store (RDS)
- Route53
- Security Groups
- Shield
- Simple Email Service (SES)
- Simple Notification Service (SNS)
- Simple Queue Service (SQS)
- Simple Storage Service (S3)
- Storage Gateways (ASG)
- Storage Gateway Volumes
- Virtual Private Cloud Service (VPC)
- Virtual Private Networks (VPN)
- Web Application Firewall (WAF)

NOTE: The following services are not monitored for GovCloud accounts:

- API Gateway private integrations
- CloudFront
- Lightsail
- OpsWorks
- Replica Lambda functions
- Shield
- Web Application Firewall

NOTE: Not all AWS services are supported by all AWS regions. For more information about which AWS services are supported by which AWS regions, see <https://aws.amazon.com/about-aws/global-infrastructure/regional-product-services>.

NOTE: To monitor performance metrics for an AutoScale group, you must activate detailed instance monitoring for that group. For instructions on how to perform this task, see <http://docs.aws.amazon.com/AutoScaling/latest/DeveloperGuide/as-instance-monitoring.html>.

NOTE: When monitoring EC2-backed ECS clusters, you can optionally use the *Docker* PowerPack to collect container information in addition to what the AWS API provides for the ECS service. For more information, see the section on [Configuring AWS Integration with Docker](#).

NOTE: To monitor Lambda services, you must first configure some of the Dynamic Applications in the Amazon Web Services PowerPack prior to discovery. For more information, see the [Configuring "AWS Lambda Service Discovery"](#) and [Configuring "AWS Lambda Function Qualified Discovery"](#) sections.

The Dynamic Applications in the PowerPack also monitor:

- The general health of each AWS service
- Current billing metrics for each service aligned with the account
- Custom, application-specific performance metrics configured on the account
- The state of any AWS Alarms set on metrics in Cloudwatch

In addition to Dynamic Applications, the PowerPack includes the following features:

- Event Policies and corresponding alerts that are triggered when AWS component devices meet certain status criteria
- Device Classes for each of the AWS component devices monitored
- Sample Credentials for discovering AWS component devices
- Reports and dashboards that display information about AWS instances and component devices
- Run Book Action and Automation policies that can automate certain AWS monitoring processes

NOTE: To view Amazon Web Services dashboards, you must first install the *Amazon Web Services: Classic Dashboards* PowerPack. For more information, see the [AWS Dashboards](#) chapter.

Installing the Amazon Web Services PowerPack

Before completing the steps in this manual, you must import and install the latest version of the *Amazon Web Services* PowerPack.

NOTE: If you are upgrading from an earlier version of the PowerPack, see the [Release Notes](#) for the version you are installing for upgrade instructions.

TIP: By default, installing a new version of a PowerPack overwrites all content from a previous version of that PowerPack that has already been installed on the target system. You can use the **Enable Selective PowerPack Field Protection** setting in the **Behavior Settings** page (System > Settings > Behavior) to prevent new PowerPacks from overwriting local changes for some commonly customized fields. (For more information, see the *System Administration* manual.)

To download and install a PowerPack:

1. Download the PowerPack from the [ScienceLogic Support Site](#).
2. Go to the **PowerPack Manager** page (System > Manage > PowerPacks).
3. In the **PowerPack Manager** page, click the **[Actions]** button, then select *Import PowerPack*.
4. The **Import PowerPack** dialog box appears:

5. Click the **[Browse]** button and navigate to the PowerPack file.
6. When the **PowerPack Installer** modal appears, click the **[Install]** button to install the PowerPack.

NOTE: If you exit the **PowerPack Installer** modal without installing the imported PowerPack, the imported PowerPack will not appear in the **PowerPack Manager** page. However, the imported PowerPack will appear in the **Imported PowerPacks** modal. This page appears when you click the **[Actions]** menu and select *Install PowerPack*.

Monitoring Consolidated Billing Accounts

Consolidated billing is an option provided by Amazon that allows multiple AWS accounts to be billed under a single account. For more information about consolidated billing, see <http://docs.aws.amazon.com/awsaccountbilling/latest/aboutv2/consolidated-billing.html>.

If a consolidated billing account is monitored by SL1, the billing metrics associated with that account include only the consolidated amounts, per service. If you use consolidated billing and want to collect billing metrics per-account, you must discover each account separately. To monitor only the billing metrics for an AWS account, you can create credentials that include only billing permissions.

ScienceLogic Events and AWS Alarms

In addition to SL1 collecting metrics for AWS instances, you can configure CloudWatch to send alarm information to SL1 via API. SL1 can then generate an event for each alarm.

For instructions on how to configure CloudWatch and SL1 to generate events based on CloudWatch alarms, see the [Configuring Inbound CloudWatch Alarms](#) section.

Chapter

2

Configuration and Discovery

Overview

Use the following menu options to navigate the SL1 user interface:

- To view a pop-out list of menu options, click the menu icon (.
- To view a page containing all the menu options, click the Advanced menu icon (.

The following sections describe how to configure and discover Amazon Web Services and component devices for monitoring by SL1 using the Amazon Web Services PowerPack:

Configuring Amazon Web Services for Monitoring	12
<i>Minimum Permissions for Dynamic Applications</i>	16
<i>Minimum Permissions for AssumeRoles in Your AWS Organization</i>	19
<i>Permissions for AWS Master Billing Account</i>	22
<i>Configuring AWS for Region-Specific Monitoring</i>	22

Relationships Between Component Devices	56
Vanishing Component Devices	58
Configuring AWS Integration with Docker	59
Configuring the AWS Dashboards	59
Amazon API Throttling Events	60

Configuring Amazon Web Services for Monitoring

To use the AWS Dynamic Applications, you must configure a credential that allows SL1 to connect to the AWS REST API. The Amazon Web Services PowerPack includes three credential templates.

To use the credential templates included in the PowerPack, you must download the security credentials for a user associated with your AWS account. The user must meet the following requirements:

- The Dynamic Applications in the Amazon Web Services PowerPack require certain minimum permissions to be set. For more information, see the [Minimum Permissions for Dynamic Applications](#) section.
- You can use the Dynamic Applications in the Amazon Web Services PowerPack to discover and monitor only specific regions and services. To do so, you must create a JSON permissions policy that uses the `NotAction`, `Allow`, and `Deny` policy elements to specify which regions and services you want to monitor or not monitor and select that policy for your AWS user. For more information, see the [Configuring AWS for Region-Specific Monitoring](#) section.
- To collect billing metrics, the user must have read permission in the us-east-1 zone. For instructions on how to configure your AWS account to report billing metrics, see the [Configuring AWS to Report Billing Metrics](#) section.

- If you are using multiple users to monitor AWS, each instance of a service must be visible to only one of those users. If an instance is visible to multiple users that are used to monitor AWS in SL1, the device record for that instance will repeatedly switch between the component trees of the accounts that have visibility to that instance.

To create a read-only user account, perform the following steps:

1. Open a browser session and go to aws.amazon.com.
2. Click **[My Account]** and then select *AWS Management Console*. If you are not currently logged in to the AWS site, you will be prompted to log in:

The screenshot shows the AWS sign-in page. At the top left is the Amazon Web Services logo. The main heading is "Sign In or Create an AWS Account". Below this is a form with the question "What is your e-mail or mobile number?". There is a text input field for the "E-mail or mobile number:". Below the input field are two radio buttons: "I am a new user." and "I am a returning user and my password is:". The "I am a returning user" option is selected. Below this is another text input field for the password. A button labeled "Sign in using our secure server" with a right-pointing arrow is below the password field. A link "Forgot your password?" is below the button. To the right of the form is a promotional banner for "Amazon Aurora" with the text "Now Available", "Amazon Aurora", "Enterprise-class database at 1/10th the cost", and a "Learn more" button. Below the form, there is a paragraph of text about security features and a link to "AWS Free Usage Tier offer terms". At the bottom, there is a section titled "About Amazon.com Sign In" with text about using Amazon.com account information. Below this is a footer with links to "Terms of Use" and "Privacy Policy", a copyright notice "© 1996-2015, Amazon.com, Inc. or its affiliates", and the text "An amazon.com company" with the Amazon logo.

amazon
webservices

Sign In or Create an AWS Account

What is your e-mail or mobile number?

E-mail or mobile number:

☐ I am a new user.

☒ I am a returning user and my password is:

Sign in using our secure server

[Forgot your password?](#)

Now Available
Amazon Aurora
Enterprise-class database at 1/10th the cost

About Amazon.com Sign In

Amazon Web Services uses information from your Amazon.com account to identify you and allow access to Amazon Web Services. Your use of this site is governed by our [Terms of Use](#) and [Privacy Policy](#) linked below.

[Terms of Use](#) [Privacy Policy](#) © 1996-2015, Amazon.com, Inc. or its affiliates

An **amazon.com** company

3. In the **AWS Management Console**, under the **Security & Identity** heading, click **[Identity & Access Management]**.
4. After logging in, the **Identity & Access Management Dashboard** page appears:

5. To create a user account for SL1, click **[Users]** on the Dashboard menu.

6. Click the **[Create New Users]** button.
7. Enter a username for the new user, e.g. "EM7", and make sure the **Generate an access key for each user** checkbox is selected.

- Click the **[Create]** button to generate your user account. The **Create User** page appears:

- Click the **[Download Credentials]** button to save your Access Key ID and Secret Key as a CSV (comma-separated value) text file, and then click **[Close]**.
- After creating a user, you must assign it a set of permissions policies. Click the username of the user account you created. The user's account information appears:

11. Under the **Permissions** heading, click the **[Attach existing policies directly]** button. The **Add permissions** page appears:

12. Select the checkbox for your policy based on the definition of the minimum required permissions described in the [Minimum Permissions for Dynamic Applications](#) section..
13. Click the **[Attach Policy]** button.

Minimum Permissions for Dynamic Applications

The following table displays the minimum permissions required for Dynamic Applications in the *Amazon Web Services PowerPack* to collect data. These permissions, among others, are in the *ReadOnlyAccess* AWS Managed policy. ScienceLogic does not recommend using this policy. Instead, ensure that the account used to discover AWS is based on the minimum permission list.

      "Resource": "arn:aws:iam::<account number>:role/Sciencelogic-Monitor"
    }
  ]
}

```

Configuring AWS for Region-Specific Monitoring

You can use the Dynamic Applications in the *Amazon Web Services PowerPack* to discover and monitor only the specific regions and services for which your AWS user has IAM policy permissions.

To monitor specific regions and services, you must create a JSON policy in the AWS Management Console that uses the `NotAction`, `Allow`, and `Deny` policy elements to specify the regions and services you want to monitor as well as which regions and services you **do not** want to monitor. You must then attach this permissions policy to the AWS user account you created.

NOTE: You must have at least Read-Only JSON policy permissions for the regions you want to monitor. You cannot discover regions for which you do not have policy permissions. At a minimum, you must at least have permissions for the us-east-1 (Virginia) region; without permissions for this region, you cannot discover general AWS services such as CloudFront, Route53, and OpsWorks.

TIP: When discovering resources in specific regions, you should ensure that any Global services or resources you want to monitor have the necessary access permissions.

NOTE: For more information about the `NotAction`, `Allow`, and `Deny` policy elements, see https://docs.aws.amazon.com/IAM/latest/UserGuide/reference_policies_elements_notaction.html.

The following sections provide two examples of region-specific JSON policies.

Example 1: One Region

This JSON Policy will deny any service that is not in the us-east-1 region. As a result, SL1 will discover only components in the us-east-1 region.

NOTE: In addition to the code below, you would need to specify the other resource permissions you want to allow in the policy.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "DenyAllOutsideUSEast1",
      "Effect": "Deny",
      "NotAction": [
        "iam:*",
        "organizations:*",
        "support:*",
        "aws-portal:*",
        "s3:ListAllMyBuckets"
      ],
      "Resource": "*",
      "Condition": {
        "StringNotEquals": {
          "aws:RequestedRegion": "us-east-1"
        }
      }
    }
  ]
}
```

Example 2: Multiple Regions

This JSON Policy will deny any service that is not in the us-east-1, us-west-2, and ap-northeast-1 regions. As a result, SL1 will discover only components in the us-east-1, us-west-2, and ap-northeast-1 regions.

NOTE: In addition to the code below, you would need to specify the other resource permissions you want to allow in the policy.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "DenyAllOutsideUSWest2USEast1APNortheast1",
      "Effect": "Deny",
      "NotAction": [
        "iam:*",
        "organizations:*",
        "support:*",
        "aws-portal:*",
        "s3:ListAllMyBuckets"
      ],
      "Resource": "*",
      "Condition": {
        "StringNotEquals": {
          "aws:RequestedRegion": ["us-east-1", "us-west-2", "ap-northeast-1"]
        }
      }
    }
  ]
}
```

Configuring AWS for Monitoring Regions with AWS Config Enabled

You can use the "AWS Region Discovery" Dynamic Application in the *Amazon Web Services PowerPack* to discover and monitor only the specific regions and services that have the AWS Config service enabled.

TIP: When discovering resources in specific regions, you should ensure that any global services or resources you want to monitor have the necessary access permissions.

NOTE: For more information about enabling the AWS Config service, see <https://docs.aws.amazon.com/config/latest/developerguide/gs-console.html>.

When configuring the AWS SOAP/XML credential for discovery, add [AUTO] to the **Embed Value [2%]** field. After discovery, only regions with AWS Config enabled will be displayed in the dynamic component map tree. Global resources will also be discovered. For more detailed steps, see the [Creating an AWS Credential](#) section.

Configuring AWS for Monitoring Regions using CloudWatch Metrics by Namespace

Users discovering with CloudWatch metrics can also discover regions where a specific namespace is available by editing the NAMESPACES field in the `aws_region_discovery` snippet in the "AWS Region Discovery" Dynamic Application.

To edit the snippet:

1. Find the "AWS Region Discovery" Dynamic Application in the **Dynamic Applications Manager** page (System > Manage > Applications) and click its wrench icon (🔧).
2. Click the **[Snippets]** tab and then click the wrench icon (🔧) for the `aws_region_discovery` snippet.
3. Edit the NAMESPACES field to include the namespace for your region. For example:

```
NAMESPACES = [ 'AWS/SQS' ]
```

4. Click **[Save]**.

Only regions that have services grouped in the specified namespace will be discovered. Global services will also be discovered.

NOTE: For more information about namespaces, see <https://docs.aws.amazon.com/cloud-map/latest/dg/working-with-namespaces.html>.

Configuring AWS to Report Billing Metrics

To use the "AWS Billing Performance Percent" Dynamic Application, your AWS account must meet the following requirements:

- The user account you supplied in the AWS credential must have permission to view the us-east-1 zone.
- Your AWS account must be configured to export billing metrics to the CloudWatch service.

If your AWS account is not configured to export billing metrics to the CloudWatch service, the "AWS Billing Performance Percent" Dynamic Application will generate the following event:

```
No billing metrics can be retrieved. Your AWS account is not configured to export billing metrics into CloudWatch.
```

To configure your AWS account to export billing metrics to the CloudWatch service, perform the following steps:

1. Open a browser session and go to aws.amazon.com.
2. Click **[My Account]** and then select *Billing & Cost Management*. If you are not currently logged in to the AWS site, you will be prompted to log in:

The screenshot shows the AWS sign-in page. At the top left is the Amazon Web Services logo. The main heading is "Sign In or Create an AWS Account". Below this is a form with the label "What is your e-mail or mobile number?". There is a text input field for the "E-mail or mobile number:". Below the input field are two radio buttons: "I am a new user." and "I am a returning user and my password is:". The "I am a returning user" option is selected. Below the radio buttons is another text input field for the password. To the right of the input fields is a yellow button that says "Sign in using our secure server" with a blue arrow icon. Below the button is a link that says "Forgot your password?". To the right of the sign-in form is a promotional banner for "Amazon Aurora" with the text "Now Available", "Amazon Aurora", "Enterprise-class database at 1/10th the cost", and a yellow "Learn more" button. At the bottom of the page, there is a section titled "About Amazon.com Sign In" with a paragraph of text. Below this is a link for "Terms of Use Privacy Policy" and a copyright notice "© 1996-2015, Amazon.com, Inc. or its affiliates". At the very bottom is the text "An amazon.com company".

Sign In or Create an AWS Account

What is your e-mail or mobile number?

E-mail or mobile number:

☐ I am a new user.

☒ I am a returning user and my password is:

[Sign in using our secure server](#)

[Forgot your password?](#)

Now Available
Amazon Aurora
Enterprise-class database at 1/10th the cost
[Learn more](#)

Learn more about [AWS Identity and Access Management](#) and [AWS Multi-Factor Authentication](#), features that provide additional security for your AWS Account. View full [AWS Free Usage Tier](#) offer terms.

About Amazon.com Sign In

Amazon Web Services uses information from your Amazon.com account to identify you and allow access to Amazon Web Services. Your use of this site is governed by our [Terms of Use](#) and [Privacy Policy](#) linked below.

[Terms of Use Privacy Policy](#) © 1996-2015, Amazon.com, Inc. or its affiliates
An [amazon.com](#) company

3. After logging in, the **Billing & Cost Management Dashboard** page appears. In the left navigation bar, click **[Preferences]**. The **Preferences** page appears:

The screenshot shows the AWS Billing & Cost Management Dashboard. The left navigation bar has 'Preferences' selected. The main content area is titled 'Preferences' and contains three sections:

- Receive PDF Invoice By Email**: Turn on this feature to receive a PDF version of your invoice by email. Invoices are generally available within the first three days of the month.
- Receive Billing Alerts**: Turn on this feature to monitor your AWS usage charges and recurring fees automatically, making it easier to track and manage your spending on AWS. You can set up billing alerts to receive email notifications when your charges reach a specified threshold. Once enabled, this preference cannot be disabled. [Manage Billing Alerts](#)
- Receive Billing Reports**: Turn on this feature to receive ongoing reports of your AWS charges once or more daily. AWS delivers these reports to the Amazon S3 bucket that you specify where indicated below. For consolidated billing customers, AWS generates reports only for paying accounts. Linked accounts cannot sign up for billing reports.

At the bottom, there is a 'Save to S3 Bucket' field with a text input 'bucket name' and a 'Verify' button. A 'Save preferences' button is at the bottom center.

4. Select the **Receive Billing Alerts** checkbox.

CAUTION: If you enable this option, this option cannot be disabled.

5. Click the **[Save Preferences]** button.

Creating a SOAP/XML Credential for AWS

To use the Dynamic Applications in the Amazon Web Services PowerPack, you must first define an AWS credential in SL1. The PowerPack includes the following sample credentials you can use as templates for creating SOAP/XML credentials for AWS:

- **AWS Credential - Proxy**, for users who connect to AWS through a third-party proxy server
- **AWS Credential - Specific Region**, for users who connect to a GovCloud account or Chinese regions
- **AWS Credential**, for users who do not use a proxy server nor connect to a specific AWS region
- **AWS Credential - EC2 Instance**, for users that want to configure a "credless" collector for AWS on an EC2 collector.
- **AWS Credential - Master Account**, for users that want to discover all enabled AWS accounts in a specific organization

To define an AWS credential:

1. Go to the **Credential Management** page (System > Manage > Credentials).

2. Locate the sample credential that you need and click its wrench icon (). The **Credential Editor** modal page appears:

3. Enter values in the following fields:

Basic Settings

- **Profile Name**. Type a new name for your AWS credential.
- **HTTP Auth User**. Type your **Access Key ID**.
- **HTTP Auth Password**. Type your **Secret Access Key**. The characters appear as asterisks to protect your password privacy.

Proxy Settings

NOTE: The **Proxy Settings** fields are required only if you are discovering AWS services through a proxy server. Otherwise, leave these fields blank.

- **Hostname/IP**. Type the host name or IP address of the proxy server.
- **Port**. Type the port on the proxy server to which you will connect.
- **User**. Type the username used to access the proxy server.
- **Password**. Type the password used to access the proxy server.

CAUTION: If you are creating a credential from the **AWS Credential - Proxy** example and the proxy server does not require a username and password, then the **User** and **Password** fields must both be blank. In that scenario, if you leave the "<Proxy_User>" text in the **User** field, SL1 cannot properly discover your AWS services.

SOAP Options

- **Embed Value [%1].** Do one of the following:
 - To monitor a GovCloud account, type "us-gov-west-1" or "us-gov-east-1".
 - To monitor the Beijing region, type "cn-north-1".
 - To monitor the Ningxia region, type "cn-northwest-1".

Otherwise, leave this field blank.

NOTE: If you are monitoring both the Beijing and Ningxia regions, you must create a unique credential for each region.

- **Embed Value [%2]:**
 - If you are using the AWS Config service and want to discover only regions that have that service enabled, type "[AUTO]" in this field. After discovery, only regions that have AWS Config enabled will be displayed in the dynamic component map tree. Global resources will also be discovered.
 - If you are using CloudWatch and want to discover only regions that have CloudWatch metrics, type "[FILTER]" in this field. After discovery, only regions that have CloudWatch metrics will be displayed in the dynamic component map tree. Global resources will also be discovered.

CAUTION: If you are performing discovery using [AUTO] or [FILTER] in the **Embed Value [%2]** field, the status of regions that don't meet these requirements will change to *Unavailable* and vanish if enabled.

NOTE: If you are performing discovery based on the AWS Config service and do not have any regions with the AWS Config service enabled, the Amazon Web Services PowerPack will discover all regions that have resources.

4. Click the **[Save As]** button, and then click **[OK]**.

Configuring the Credential to Discover AWS on an EC2 Collector

To discover AWS on an EC2 collector, you must have an IAM role created on either a member account or the master account and assigned to the EC2 instance.

To define an AWS credential to discover AWS on an EC2 collector:

1. Go to the **Credential Management** page (System > Manage > Credentials).
2. Locate the **AWS Credential - EC2 Instance** sample credential that you need and click its wrench icon (🔧). The **Credential Editor** modal page appears:

The screenshot shows the 'Credential Editor [114]' window. It has a title bar with a close button. Inside, there's a tab labeled 'Edit SOAP/XML Credential #114' with 'New' and 'Reset' buttons. The main area is divided into several sections: 'Basic Settings' with fields for Profile Name (AWS Credential - EC2 Instance), Content Encoding (text/xml), Method (POST), HTTP Version (HTTP/1.1), URL (https://organizations.us-east-1.amazonaws.com), HTTP Auth User (IAM), HTTP Auth Password, and Timeout (5); 'Proxy Settings' with Hostname/IP, Port (0), and User; 'CURL Options' with a list of options and arrows; 'Soap Options' with an Embedded Password field and four Embed Value fields; and 'HTTP Headers' with a list of headers including OrganizationArn, AssumeRole, AssumeRoleSession, and Regions. At the bottom are 'Save' and 'Save As' buttons.

3. Enter values in the following fields:

Basic Settings

- **Profile Name.** Type a new name for your AWS credential.
- **URL.** Type `https://organizations.us-east-1.amazonaws.com` in the field. If your administrator has configured a different region, you can change it or use the default region.
- **HTTP Auth User.** Leave the default value "IAM" in the field.

HTTP Headers

- Click **+ Add a header** to add a header field. You can enter the following options:
 - *OrganizationArn*. Defines the ARN for the AssumeRole.
 - *AssumeRole*. Type the AWS Role you created in each account. The default name is "ScienceLogic-Monitor".
 - *AssumeRoleSession*. Optional. The default value is "AssumeRoleSession:SL1".
 - *Regions*. The regions entered in this field will be discovered. For example, entering "Regions:ap-southeast-2, us-east-2" will discover two regions. If left blank, all regions will be discovered. The default value is "Regions:ALL".

4. Click the **[Save As]** button, and then click **[OK]**.

Configuring the Credential to Discover all Enabled Accounts in an AWS Organization

For organization-based discovery, you can use your master organization account to automatically discover all AWS accounts, instead of having to enter a key for each account. This process will also create a separate DCM tree for each account.

NOTE: Discovery of GOV and China accounts does not support alignment using AssumeRole. For those accounts customers must continue to use manual alignment of Dynamic Applications.

You must have the following prerequisites to use this feature:

- An IAM key from the master billing account
- An AssumeRole with the same name as the AssumeRole entered in the credential

To define an AWS credential to discover all enabled AWS accounts in an organization:

1. Go to the **Credential Management** page (System > Manage > Credentials).

2. Locate the **AWS Credential - Master Account** sample credential that you need and click its wrench icon (). The **Credential Editor** modal page appears:

The screenshot shows the 'Credential Editor [115]' window. It has a title bar with a close button. Below the title bar is a subtitle 'Edit SOAP/XML Credential #115' and two buttons: 'New' and 'Reset'. The main area is divided into several sections: 'Basic Settings' with fields for Profile Name (AWS Credential - Master Account), Content Encoding (text/xml), Method (POST), HTTP Version (HTTP/1.1), URL (https://organizations.us-east-1.amazonaws.com), HTTP Auth User (AWS Account Access Key), HTTP Auth Password, and Timeout (seconds) (5); 'Proxy Settings' with fields for Hostname/IP, Port (0), and User; 'CURL Options' with a list of options (CAINFO, CAPATH, CLOSEPOLICY, CONNECTTIMEOUT, COOKIE, COOKIEFILE, COOKIEJAR, COOKIELIST, CRLF, CUSTOMREQUEST, DNSCACHETIMEOUT) and a large text area; 'Soap Options' with an Embedded Password field and four Embed Value fields; and 'HTTP Headers' with a '+ Add a header' button and three header fields (AssumeRole: ScienceLogic-Monitor, AssumeRoleSession: SL1, Regions: ALL). At the bottom are 'Save' and 'Save As' buttons.

3. Enter values in the following fields:

Basic Settings

- **Profile Name.** Type a new name for your AWS credential.
- **URL.** Type `https://organizations.us-east-1.amazonaws.com` in the field. If your administrator has configured a different region, you can change it or use the default region.
- **HTTP Auth User.** Type the AWS access key ID of the user you created in the master account.
- **HTTP Auth Password.** Type the AWS secret access key of the user created in the master account.

HTTP Headers

- Click **+ Add a header** to add a header field. You can enter the following options:
 - **AssumeRole.** Type the AWS Role you created in each account. The default name is "ScienceLogic-Monitor".
 - **AssumeRoleSession.** Optional. The default value is "AssumeRoleSession:SL1".
 - **Regions.** The regions entered in this field will be discovered. For example, entering "Regions:ap-southeast-2, us-east-2" will discover two regions. If left blank, all regions will be discovered. The default value is "Regions:ALL".

4. Click the **[Save As]** button, and then click **[OK]**.

NOTE: If the "AWS Account Creation" Dynamic Application is reporting that it is unable to use your AssumeRole, double-check your trust relationships on your configured roles.

Testing the AWS Credential

SL1 includes a Credential Test for Amazon Web Services. Credential Tests define a series of steps that SL1 can execute on demand to validate whether a credential works as expected.

The AWS Credential Test can be used to test a SOAP/XML credential for monitoring AWS using the Dynamic Applications in the Amazon Web Services PowerPack. The AWS Credential Test performs the following steps:

- **Test Reachability.** Performs an ICMP ping request to the URL for the EC2 service in the region specified in the credential. If a region is not specified in the credential, the us-east-1 region is used.
- **Test Port Availability.** Performs an NMAP request to TCP port 443 on the URL for the EC2 service in the region specified in the credential. If a region is not specified in the credential, the us-east-1 region is used.
- **Test Name Resolution.** Performs an nslookup request on the URL for the EC2 service in the region specified in the credential. If a region is not specified in the credential, the us-east-1 region is used.
- **Make connection to AWS account.** Attempts to connect to the AWS service using the account specified in the credential.
- **Scan AWS services.** Verifies that the account specified in the credential has access to the services.

NOTE: The AWS Credential Test does not support the testing of credentials that connect to AWS through a proxy server.

To test the AWS credential:

1. Go to the **Credentials** page (Manage > Credentials).
2. Click **[Test Credentials]**. The **Credential Test Form** modal page appears. Fill out the following fields on this page:
 - **Credential.** Select the AWS credential to test. This drop-down list includes only credentials that you have access to. (If you clicked the **Actions** button (☰) and then selected *Test* for a specific credential, then this field is read-only.)
 - **Select Credential Test.** Select **AWS Credential Test**.
 - **Collector.** Select the All-In-One Appliance or Data Collector that will run the test.
 - **IP or Hostname to Test.** Enter a valid IP address.
4. Click the **[Run Test]** button to run the credential test. The **Testing Credential** window appears:

STEP	DESCRIPTION	LOG MESSAGE	STATUS
Test Reachability	Check to see if the device is reachable using ICMP	The device is reachable using ICMP. The average response time is 2....	Passed
Test Port Availability	Check to see if the appropriate port is open	Port 443 is open	Passed
Test Name Resolution	Check to see if nslookup can resolve the IP and hostname	Name resolution failed: Reverse failed, Forward failed	Failed
Make n1IR1 Request	Check to see if a n1IR1 request succeeds	n1IR1 request failed: HTTP 400	Failed

The **Testing Credential** window displays a log entry for each step in the credential test. The steps performed are different for each credential test. The log entry for each step includes the following information:

- **Step.** The name of the step.
- **Description.** A description of the action performed during the step.
- **Log Message.** The result of the step for this execution of the credential test.
- **Status.** Whether the result of this step indicates the credential and/or the network environment is configured correctly (Passed) or incorrectly (Failed).
- **Step Tip.** Mouse over the question mark icon (?) to display the tip text. The tip text recommends what to do to change the credential and/or the network environment if the step has a status of "Failed".

Testing the AWS Credential in the SL1 Classic User Interface

SL1 includes a Credential Test for Amazon Web Services. Credential Tests define a series of steps that SL1 can execute on demand to validate whether a credential works as expected.

The AWS Credential Test can be used to test a SOAP/XML credential for monitoring AWS using the Dynamic Applications in the *Amazon Web Services PowerPack*. The AWS Credential Test performs the following steps:

- **Test Reachability.** Performs an ICMP ping request to the URL for the EC2 service in the region specified in the credential. If a region is not specified in the credential, the us-east-1 region is used.
- **Test Port Availability.** Performs an NMAP request to TCP port 443 on the URL for the EC2 service in the region specified in the credential. If a region is not specified in the credential, the us-east-1 region is used.
- **Test Name Resolution.** Performs an nslookup request on the URL for the EC2 service in the region specified in the credential. If a region is not specified in the credential, the us-east-1 region is used.
- **Make connection to AWS account.** Attempts to connect to the AWS service using the account specified in the credential.
- **Scan AWS services.** Verifies that the account specified in the credential has access to the services.

NOTE: The AWS Credential Test does not support the testing of credentials that connect to AWS through a proxy server.

To test the AWS credential:

1. Go to the **Credential Test Management** page (System > Customize > Credential Tests).
2. Locate the **AWS Credential Test** and click its lightning bolt icon (⚡). The **Credential Tester** modal page appears:

Credential Tester [BETA]

Test Type: [AWS Credential Test]

Credential: Amazon Web Services Credential

Hostname/IP:

Collector: [RS-DCU-69]

Run Test

3. Supply values in the following fields:
 - **Test Type**. This field is pre-populated with the credential test you selected.
 - **Credential**. Select the credential to test. This drop-down list includes only credentials that you have access to that can be tested using the selected credential test.
 - **Hostname/IP**. Leave this field blank.
 - **Collector**. Select the All-In-One Appliance or Data Collector that will run the test.
4. Click the **[Run Test]** button to run the credential test. The **Test Credential** window appears:

Test Credential Test execution complete			
Step	Description	Log Message	Status
1 Test Reachability	Check to see if the EC2 service is reachable using ICMP	The EC2 service is reachable using ICMP. The average response time is 3.400ms	Passed
2 Test Port Availability	Check to see if the EC2 HTTPS port is open	Port 443 is open	Passed
3 Test Name Resolution	Check to see if nslookup can resolve the EC2 Service	Name resolution succeeded: Forward returned 1 result	Passed
4 Make connection to AWS account	Check to see if an AWS account can be connected to and queried	AWS connection succeeded	Passed
5 Scan AWS Services	Verify services are available to specified account.	AWS service scan succeeded	Passed

The **Test Credential** window displays a log entry for each step in the credential test. The steps performed are different for each credential test. The log entry for each step includes the following information:

- **Step**. The name of the step.
- **Description**. A description of the action performed during the step.
- **Log Message**. The result of the step for this credential test.
- **Status**. Whether the result of this step indicates the credential or the network environment is configured correctly (Passed) or incorrectly (Failed).
- **Step Tip**. Mouse over the question mark icon (?) to display the tip text. The tip text recommends what to do to change the credential or the network environment if the step has a status of "Failed".

AWS Guided Discovery

You can use the Universal Discovery Framework process in SL1 that guides you through a variety of existing discovery types in addition to traditional SNMP discovery. This process, which is also called "guided discovery", lets you pick a discovery type based on the type of devices you want to monitor. The Universal Discovery workflow includes a button for Amazon Web Services.

NOTE: If you want to discover one of the third-party products that are available as an option when using the Universal Discovery workflow, you must have the corresponding PowerPack installed on your SL1 system to ensure that the appropriate Dynamic Applications, Device Classes, and other elements can be utilized for discovery. For example, if you want to discover an Amazon Web Services account, you must have the *Amazon Web Services* PowerPack installed.

To run a guided or Universal Discovery:

1. On the **Devices** page (🖨️) or the **Discovery Sessions** page (Devices > Discovery Sessions), click the **[Add Devices]** button. The **Select** page appears.

2. Select the **Amazon Web Services** button. Additional information about the requirements for device discovery appears in the **General Information** pane to the right.
3. Click **[Select]**. The **Credential Selection** page appears.

Create Discovery Session

5. Complete the following fields:

- **Root Device Name.** Type the name of the root device for the Amazon Web Services root device you want to monitor.
- **Select the organization to add discovered devices to.** Select the name of the organization to which you want to add the discovered device.
- **Collector Group Name.** Select an existing collector group to communicate with the discovered device. This field is required.

6. Click **[Next]**. SL1 creates the AWS root device with the appropriate Device Class assigned to it and aligns the relevant Dynamic Applications. The **Final Summary** page appears.

8. Click **[Close]**.

NOTE: The results of a guided discovery do not display on the **Discovery Sessions** page (Devices > Discovery Sessions).

Creating an AWS Virtual Device for Discovery in the SL1 Classic User Interface

Because the Amazon Web Service does not have a specific IP address, you cannot discover an AWS device using discovery. Instead, you must create a **virtual device** that represents the Amazon Web Service. A virtual device is a user-defined container that represents a device or service that cannot be discovered by SL1. You can use the virtual device to store information gathered by policies or Dynamic Applications.

To create a virtual device that represents your Amazon service:

1. Go to the **Device Manager** page (Devices > Device Manager or Registry > Devices > Device Manager in the SL1 classic user interface).
2. Click the **[Actions]** button, then select *Create Virtual Device*. The **Virtual Device** modal page appears:

3. Enter values in the following fields:
 - **Device Name.** Enter a name for the device. For example, you could enter "Amazon Cloud" in this field.
 - **Organization.** Select the organization for this device. The organization the device is associated with limits the users that will be able to view and edit the device.
 - **Device Class.** Select Service | AWS Service.
 - **Collector.** Select the collector group that will monitor the device.
4. Click the **[Add]** button to create the virtual device.

Discovering the AWS Account in the SL1 Classic User Interface

To discover your AWS account, you must manually align the "AWS Account Discovery" Dynamic Application with the AWS virtual device. After you do so, the other Dynamic Applications in the *Amazon Web Services PowerPack* will automatically align to discover and monitor all of the components in your AWS account.

TIP: If your AWS account includes API Gateways or Lambda services to be monitored and you want SL1 to put those component devices in a "vanished" state if the platform cannot retrieve data about them for a specified period of time, ScienceLogic recommends setting the **Component Vanish Timeout Mins.** field to at least 120 minutes. For more information, see the chapter on "Vanishing and Purging Devices" in the *Device Management* manual.

To align the "AWS Account Discovery" Dynamic Application to your virtual device:

1. Go to the **Device Manager** page (Devices > Device Manager or Registry > Devices > Device Manager in the SL1 classic user interface).
2. Click the wrench icon () for your virtual device.
3. In the **Device Administration** panel, click the **[Collections]** tab. The **Dynamic Application Collections** page appears:
4. Click the **[Actions]** button, and then select *Add Dynamic Application* from the menu.
5. In the **Dynamic Application Alignment** modal page, select *AWS Account Discovery* in the **Dynamic Applications** field.
6. In the **Credentials** field, select the *credential you created for your AWS service*.

- Click the **[Save]** button to align the Dynamic Application.

AWS Discovery for Accounts Using AssumeRole

To discover AWS Accounts in an AWS Organization using AssumeRole, perform the following steps:

NOTE: Before running discovery for accounts using Assume Role, disable the "AWS Account Discovery" Dynamic Application.

- On the **Devices** page () or the **Discovery Sessions** page (Devices > Discovery Sessions), click the **[Add Devices]** button. The **Select** page appears.
- Click the **[Unguided Network Discovery]** button. Additional information about the requirements for discovery appears in the **General Information** pane to the right.
- Click **[Select]**. The **Add Devices** page appears.

4. Supply values in the following fields:

- **Name.** Type a unique name for this discovery session. This name is displayed in the list of discovery sessions on the **[Discovery Sessions]** tab.
- **Description.** Type a short description of the discovery session. You can use the text in this description to search for the discovery session on the **[Discovery Sessions]** tab. This field is optional.
- **Select the organization to add discovered devices to.** Select the name of the organization to which you want to add the discovered devices.

5. Click **[Next]**. The **Credentials** page of the **Add Devices** wizard appears.

6. On the **Credentials** page of the **Add Devices** wizard, select the credential you created. The **Discovery Session Details** page of the **Add Devices** wizard appears.

7. Complete the following fields:

- **List of IPs/Hostnames.** Type the URL of your AWS master billing account.
- **Which collector will monitor these devices?** Select an existing collector to monitor the discovered devices. Required.

In the **Advanced options** section, complete the following fields:

- **Model Devices.** Enable this setting.
- **Discover Non-SNMP.** Enable this setting.

NOTE: If you discontinue monitoring on any devices that are using the Assume Role authentication method, ScienceLogic recommends the best practice of first disabling the devices, deleting the devices from the DCM tree, and then cleaning up any AWS permissions in IAM. This will avoid any unnecessary alerts.

AWS Discovery for Accounts Using AssumeRole in the SL1 Classic User Interface

To discover AWS Accounts in an AWS Organization using AssumeRole, perform the following steps:

NOTE: Before running discovery for accounts using Assume Role, disable the "AWS Account Discovery" Dynamic Application.

1. Go to the **Discovery Control Panel** page (System > Manage > Classic Discovery).

- Click the **[Create]** button. The **Discovery Session Editor** page appears:

- Supply values in the following fields:
 - IP Address Discovery List.** Type the URL of your AWS master billing account.
 - Other Credentials.** Select the credential you created.
 - Discover Non-SNMP.** Select this checkbox.
 - Model Devices.** Select this checkbox.
- Optionally, supply values in the other fields in this page. For a description of the fields in this page, see the **Discovery & Credentials** manual.
- Click the **[Save]** button.
- The **Discovery Control Panel** page will refresh. Click the lightning bolt icon () for the discovery session you just created.
- In the pop-up window that appears, click the **[OK]** button. The page displays the progress of the discovery session.

NOTE: If you discontinue monitoring on any devices that are using the Assume Role authentication method, ScienceLogic recommends the best practice of first disabling the devices, deleting the devices from the DCM tree, and then cleaning up any AWS permissions in IAM. This will avoid any unnecessary alerts.

Configuring AssumeRole with a Proxy Server

If you use a proxy server, you can still run discovery using an AssumeRole through the creation of a virtual device.

To use AssumeRole with a proxy server, perform the following steps to create a virtual device and align the appropriate run book action:

1. Go to the **Device Manager** page (Devices > Device Manager or Registry > Devices > Device Manager in the SL1 classic user interface).
2. Click the **[Actions]** button, then select *Create Virtual Device*. The **Virtual Device** modal page appears:
3. Enter values in the following fields:
 - **Device Name**. Enter a name for the device. For example, you could enter "Amazon Cloud" in this field.
 - **Organization**. Select the organization for this device. The organization the device is associated with limits the users that will be able to view and edit the device.
 - **Device Class**. Select *Service | AWS Service*.
 - **Collector**. Select the collector group that will monitor the device.
4. Click the **[Add]** button to create the virtual device.
5. Find the newly-created virtual device in the **Device Manager** page (Devices > Device Manager or Registry > Devices > Device Manager in the SL1 classic user interface and click its wrench icon ().
6. Select the **[Collections]** tab to open the **Dynamic Application Collections** page.
7. In the **Dynamic Application Collections** page, click the **[Actions]** button and select **Add Dynamic Application**.
8. In the **Dynamic Applications** field, select the "AWS Organization Creation" Dynamic Application.
9. In the **Credentials** field, select the credential you created that contains your AssumeRole.
10. Click the **[Save]** button.

Understanding the AWS Dynamic Applications

The Dynamic Applications in the *Amazon Web Services PowerPack* are divided into four types:

- **Discovery**. These Dynamic Applications poll AWS for new instances of services or changes to existing instances of services.
- **Configuration**. These Dynamic Applications retrieve configuration information about each service instance and retrieve any changes to that configuration information.
- **Performance**. These Dynamic Applications poll AWS for performance metrics.
- **Health**. These Dynamic Applications collect the RSS status update messages from the Amazon Health Status page (<http://status.aws.amazon.com/>).

Service Discovery Dynamic Applications are responsible for searching the AWS cloud for instances of specific services. Typically, a Service Discovery Dynamic Application will then align Discovery Dynamic Applications for each AWS service it discovers, Performance Dynamic Applications for each discovered service, and Configuration Dynamic Applications for each discovered service.

For example, the Dynamic Application "AWS EC2 Service Discovery" will create a component device for the EC2 service and align the Dynamic Applications "EC2 Service Performance", "EC2 Service Health", and "EC2 Instance Discovery" to that component device.

The Dynamic Application "EC2 Instance Discovery" will create component devices for each EC2 instance and align the Dynamic Applications "EC2 Instance Configuration", "EC2 Instance Performance", and "EBS Discovery" to that component device.

The general Dynamic Application hierarchy is:

- Account Discovery
 - Region Discovery
 - Zone Discovery
 - Service Discovery
 - Service Performance
 - Service Health
 - Instance Discovery
 - Instance Configuration
 - Instance Performance

AWS Account Discovery

The Dynamic Application "AWS Account Discovery" is the root Dynamic Application that retrieves the user's account permissions. The "Account" component device uses the full user ID as the device name.

The "AWS Account Discovery" Dynamic Application aligns the "AWS Region Discovery" Dynamic Application to the account component device. This Dynamic Application discovers the AWS Regions that contain services for the user.

The "AWS Account Discovery" Dynamic Application retrieves account-specific performance statistics such as total number of API calls and custom (application-specific) performance metrics.

Configuring "AWS Lambda Service Discovery"

By default, the "AWS Lambda Service Discovery" Dynamic Application is configured to discover only regular Lambda functions, not replica functions. If you want to discover both regular and replica Lambda functions, then you must configure the "AWS Lambda Service Discovery" Dynamic Application to do so **prior** to discovering your Lambda service.

To configure the "AWS Lambda Service Discovery" Dynamic Application to discover both regular and replica Lambda functions:

1. Go to the **Dynamic Applications Manager** page (System > Manage > Applications).
2. Locate the "AWS Lambda Service Discovery" Dynamic Application and click its wrench icon (). The **Dynamic Applications Properties Editor** page appears.
3. In the **Operational State** field, select *Disabled*, and then click **[Save]**. This disables the Dynamic Application from collecting data.

[Select Action] Go

11. Repeat step 10 for all of the remaining Collection Objects listed in the **Collection Object Registry** pane.
12. Click the **[Properties]** tab.
13. In the **Operational State** field, select *Enabled*, and then click **[Save]**. This re-enables data collection for the Dynamic Application.

NOTE: If you configure the "AWS Lambda Service Discovery" Dynamic Application to discover both regular and replica Lambda functions, then when you run discovery, the Dynamic Applications in the Amazon Web Services PowerPack will create *parent/child relationships* between replica Lambda functions and their corresponding master Lambda functions. In this scenario, the *Device View and other device component maps* will display the relationship in this order: Lambda Function Service > Lambda Replica Function > Master Lambda Function. The replica appears as the parent to the master Lambda function because the replica could be in the same or a different region than the master Lambda function.

Configuring "AWS Lambda Function Qualified Discovery"

By default, the "AWS Lambda Function Qualified Discovery" Dynamic Application is configured to discover and model all Lambda alias components. An **alias** is a qualifier inside an AWS Lambda function that enables the user to control which versions of the Lambda function are executable—for instance, a production version and a test version.

When the "AWS Lambda Function Qualified Discovery" Dynamic Application is configured to discover alias components, SL1 collects data only for the Lambda function versions specified in the alias.

Depending on your needs, you can optionally configure the Dynamic Application to instead do one of the following:

- Discover and model all Lambda version components. If you select this configuration, SL1 collects data for all existing versions of the Lambda function.
- Discover and model only Lambda version components with AWS configurations filtered by a trigger. If you select this configuration, SL1 collects data only for versions of the Lambda function that have triggers or are specified in an alias.

NOTE: If you have [configured the "AWS Lambda Service Discovery" Dynamic Application](#) to discover both regular and replica Lambda functions and you want SL1 to [create dynamic component map relationships](#) between replica Lambda functions and their parent Lambda function versions, you must follow these instructions to configure the "AWS Lambda Function Qualified Discovery" Dynamic Application to discover and model all Lambda version components.

To configure the "AWS Lambda Function Qualified Discovery" Dynamic Application:

1. Go to the **Dynamic Applications Manager** page (System > Manage > Applications).
2. Locate the "AWS Lambda Function Qualified Discovery" Dynamic Application and click its wrench icon (). The **Dynamic Applications Properties Editor** page appears.

3. In the **Operational State** field, select *Disabled*, and then click **[Save]**. This disables the Dynamic Application from collecting data.

The screenshot shows the 'Dynamic Applications [1442] | Properties Editor' window. The 'Operational State' dropdown menu is set to 'Disabled' and is highlighted with a red box. The 'Save' button is also highlighted with a red box. The interface includes tabs for Close, Properties, Collections, Snippets, Thresholds, Alerts, Component, and Subscribers. The main area shows configuration options for Application Name, Version Number, Abandon Collection, Context, Caching, Device Dashboard, Poll Frequency, Null Row Option, Null Column Option, Disable Rollup of Data, and Component Mapping. A description field contains text about Amazon Web Lambda Function Qualified Service. A release notes section shows 'Version 1.0' with a description of the initial version.

4. Click the **[Snippets]** tab. The **Dynamic Applications Snippet Editor & Registry** page appears. The **Snippet Registry** pane includes the following snippets:
 - *aws_lambda_function_aliases_discovery*. When this snippet is enabled, the Dynamic Application discovers all Lambda alias components.
 - *aws_lambda_function_all_versions_discovery*. When this snippet is enabled, the Dynamic Application discovers all Lambda version components.
 - *aws_lambda_function_versions_by_triggers_discovery*. When this snippet is enabled, the Dynamic Application discovers Lambda version components with AWS configurations containing a trigger or those with an alias.

5. One at a time, click the wrench icon (🔧) for each of the snippets, select *Enabled* or *Disabled* in the **Active State** field, and then click **[Save]** to enable the appropriate snippet and disable the others.

Dynamic Applications [1442] | Snippet Editor & Registry | Editing Snippet [1787]

7	Qualifier	Config Character	10	qualifier	1	o_16777	--	Disabled	Left	2018-07-09 11:30:58	☐

[Select Action] Go

- Repeat step 7 for all of the remaining Collection Objects listed in the **Collection Object Registry** pane.
- Click the **[Properties]** tab.
- In the **Operational State** field, select *Enabled*, and then click **[Save]**. This re-enables data collection for the Dynamic Application. The next time discovery is run, new component devices might be discovered and some previously discovered components might become unavailable, depending on how you configured the Dynamic Application.

NOTE: If you configure the "AWS Lambda Function Qualified Discovery" Dynamic Application to discover Lambda alias or version components and your AWS service includes an API Gateway that triggers a Lambda Function, then the Dynamic Applications in the Amazon Web Services PowerPack will create [a device relationship](#) between that Lambda Function and its corresponding Lambda alias or version component device.

Viewing AWS Component Devices

When SL1 performs collection for the AWS virtual device, SL1 will create component devices that represent each element in your AWS infrastructure and align other Dynamic Applications to those component devices. Some of the Dynamic Applications aligned to the component devices will also be used to create additional component devices. All component devices appear in the **Device Manager** page (Registry > Devices > Device Manager).

In addition to the **Device Manager** page, you can view the AWS service and all associated component devices in the following places in the user interface:

- The **Device Investigator Map** page (click **Map** in the **Device Investigator** page) displays a map of a particular device and all of the devices with which it has parent-child relationships. Double-clicking any of the listed devices reloads the page to make the selected device the primary device
- The **Device Components** page (Devices > Device Components) displays a list of all root devices and component devices discovered by SL1 in an indented view, so you can easily view the hierarchy and relationships between child devices, parent devices, and root devices. To view the component devices associated with an AWS service, find the AWS virtual device and click its plus icon (+).
- The **Component Map** page (Classic Maps > Device Maps > Components) allows you to view devices by root node and view the relationships between root nodes, parent components, and child components in a map. This makes it easy to visualize and manage root nodes and their components. SL1 automatically updates the **Component Map** as new component devices are discovered. SL1 also updates each map with the latest status and event information. To view the map for an AWS service, go to Classic Maps > Device Maps > Components, and select the map from the list in the left NavBar. To learn more about the **Component Map** page, see the **Views** manual.

- The **Component Map** page (Classic Maps > Device Maps > Components) allows you to view devices by root node and view the relationships between root nodes, parent components, and child components in a map. This makes it easy to visualize and manage root nodes and their components. SL1 automatically updates the **Component Map** as new component devices are discovered. SL1 also updates each map with the latest status and event information. To view the map for an AWS service, go to Classic Maps > Device Maps > Components, and select the map from the list in the left NavBar. To learn more about the **Component Map** page, see the **Views** manual.

Relationships Between Component Devices

In addition to the parent/child relationships between component devices, relationships are automatically created by the Dynamic Applications in the Amazon Web Services PowerPack between the following component devices:

- AWS API Gateway Services and AWS Network Load Balancers
- AWS API Instances and AWS Lambda Functions
- AWS Application ELBs and AWS Availability Zones
- AWS Application ELBs and AWS Route 53-Hosted Zones
- AWS Application ELBs and AWS Security Groups
- AWS Application ELBs and AWS Target Groups
- AWS Application ELBs and AWS VPC Instances
- AWS Auto Scale Groups and AWS Auto Scale Launch Configurations
- AWS Direct Connect Virtual Instances and AWS Virtual Private Gateways
- AWS ECS Instances and AWS EC2 Instances
- AWS ECS Services and AWS Classic Load Balancers
- AWS ECS Services and AWS Security Groups
- AWS ECS Services and AWS Target Groups

- AWS ECS Services and AWS VPC Instances
- AWS ECS Services and AWS VPC Subnets
- AWS EC2 Instances and AWS Auto Scale Groups
- AWS EC2 Instances and AWS EBS Volumes
- AWS EC2 Instances and AWS Elastic Beanstalk Applications
- AWS EC2 Instances and AWS ELB Instances
- AWS EC2 Instances and AWS EMR Instances
- AWS EC2 Instances and AWS OpsWorks Instances
- AWS EC2 Instances and AWS Security Groups
- AWS EC2 Instances and AWS Target Groups
- AWS EC2 Instances and AWS VPC Instances
- AWS EC2 Instances and AWS VPC Subnets
- AWS EC2 Instances and the Cisco Cloud Center application
- AWS Lambda Functions and AWS Security Groups
- AWS Lambda Functions and AWS Simple Notification Services (SNS)
- AWS Lambda Functions and AWS Simple Queue Services (SQS)
- AWS Lambda Functions and AWS VPC Instances
- AWS Lambda Functions and AWS VPC Subnets
- AWS Lambda Function Qualified Services and AWS Security Groups
- AWS Lambda Function Qualified Services and AWS VPC Instances
- AWS Lambda Function Qualified Services and AWS VPC Subnets
- AWS Lambda Function Replicas and their parent AWS Lambda Function Versions
- AWS Network ELBs and AWS Availability Zones
- AWS Network ELBs and AWS Route 53-Hosted Zones
- AWS Network ELBs and AWS Target Groups
- AWS Network ELBs and AWS VPC Instances
- AWS Organizations and AWS Accounts
- AWS Redshift Instances and AWS Security Groups
- AWS Redshift Instances and AWS VPC Instances
- AWS Route Tables and AWS Virtual Private Gateways
- AWS Route Tables and AWS VPC Subnets
- AWS S3 Instances and AWS CloudTrail Instances
- AWS Security Groups and AWS VPC Instances
- AWS SNS Instances and AWS CloudTrail Instances
- AWS SNS Instances and AWS Glacier Instances

- AWS VPC Instances and AWS ELB Instances
- AWS VPC Instances and AWS Target Groups
- AWS VPC Instances and other intra-account AWS VPC Instances

Vanishing Component Devices

If SL1 cannot retrieve information about a component device for the amount of time specified in the **Component Vanish Timeout** field (in either the **Global Threshold Settings** page, the **Device Thresholds** page for the component device, or the **Device Thresholds** page for a device higher in the component tree), SL1 sets the device to "vanished".

When a device is set to "vanished", SL1 stops trying to collect data about the component device. The vanished device will not appear in reports or views. The vanished device will appear only in the **Vanished Device Manager** page. When a device is set to "vanished", all children of that device are also set to "vanished".

NOTE: This section describes the standard device vanishing behavior that **does not** use the "AWS: Vanish Terminated EC2 Instances" Run Book Action and Automation policies. If you use the "AWS: Vanish Terminated EC2 Instances" Run Book Action and Automation policies, see the chapter on [AWS Run Book Actions and Automations](#) in this manual for more information about device vanishing.

Most AWS component devices operate using the standard SL1 vanishing logic: If the device is terminated in AWS, it then becomes unavailable in SL1. If the device is unavailable for the amount of time specified in the **Component Vanish Timeout** field, then that device is vanished.

However, two AWS component device types operate using slightly different logic:

- **EC2.** EC2 instances that are deleted in AWS still appear in the AWS portal for one to two hours in a *terminated* state. If SL1 polls that device and receives a response from AWS that the EC2 is terminated, SL1 will classify the device as unavailable. If the **Component Vanish Timeout** setting has been enabled, then SL1 will vanish this device automatically. If, however, the EC2 instance has merely been *stopped* rather than terminated, SL1 will not vanish the device, even if the **Component Vanish Timeout** setting has been enabled.
- **RDS.** RDS instances that have a status of *stopped* or *stopping* in AWS will be classified as unavailable in SL1. If the **Component Vanish Timeout** setting has been enabled, then SL1 will vanish this device automatically.

ScienceLogic recommends setting the **Component Vanish Timeout** to *120 minutes* when monitoring AWS accounts.

For more information about vanishing devices, see the chapter on "Vanishing & Purging Devices" in the **Device Management** manual.

Configuring AWS Integration with Docker

If you have discovered EC2-backed ECS clusters using the *Amazon Web Services PowerPack*, you can optionally use the *Docker PowerPack* to collect container information in addition to what the AWS API provides for the ECS service.

NOTE: This integration does not work with Fargate-backed ECS clusters.

To configure this integration, cURL version 7.40 or later must be installed on the ECS AMI image. For example, the 2018.03 ECS AMI image is compatible because it includes cURL 7.43.1.

Additionally, you must install the most recent version of the *Docker PowerPack* on your SL1 System and run a discovery session using an SSH credential that will work on the EC2 host(s). This discovery session will discover the EC2 instances that comprise the ECS cluster and align the Docker host Dynamic Applications with those EC2 instances. Optionally, you can merge the EC2 host with the Docker host if you so choose.

NOTE: For more information about the *Docker PowerPack*, including instructions about creating the SSH credential and running discovery, see the *Monitoring Docker* manual.

NOTE: ScienceLogic does not recommend enabling and securing the Docker HTTP API when aligning EC2 instances with Docker hosts. Doing so requires you to complete manual steps on each EC2 host. Furthermore, if you use this method and then merge the EC2 host with the Docker host, data collection will fail for all containers that are children of the merged host.

Configuring the AWS Dashboards

The AWS Account Billing and AWS Health Status dashboards must have their (base) Custom Table widgets manually configured to filter only AWS service-specific events. To do this:

1. Go to Dashboards > Classic Dashboards > AWS Account Billing or Dashboards > AWS Account Billing in the SL1 classic user interface.
2. Click the down-arrow in the upper-right of the AWS Events widget, and then select *Configure* from the **Options** menu. The **Widget Configuration** modal page appears.

3. In the **Device Class** filter, enter "AWS" to show only AWS device classes:

4. Control-click on the following items in the **Device Class** field:

- AWS DDB Service
- AWS EC2 Service
- AWS ELB Service
- AWS EMR Service
- AWS RDS Service
- AWS SNS Service
- AWS SQS Service
- AWS Storage Gateway Service

- Click the **[Save]** button.
- Repeat steps 1 - 5 for the AWS Health Status dashboard.

Amazon API Throttling Events

By default, SL1 will use the Collector Group aligned with the root AWS virtual device to retrieve data from AWS devices and services.

If SL1 must collect data from a large set of AWS devices and services, SL1 might generate Notify events with a message ending in the text "Retry #1-10 Sleeping: ... seconds". SL1 generates these events when the Amazon API throttles collection in response to a large number of requests to the API. Even though SL1 is generating Notify "Retry" events, SL1 is still collecting data from AWS. This issue commonly occurs when a specific Amazon data center edge is close to capacity.

If SL1 generates the Minor event "Collection missed on <device> on 5 minute poll", this indicates that SL1 was unable to retrieve that specific datum from the Amazon cloud during the most recent five-minute polling cycle. If you frequently see the "Collection missed" event across your cloud, you must contact Amazon support to whitelist the IP address of your Data Collector. This will prevent further throttling from occurring.

Configuring Inbound CloudWatch Alarms

Overview

The following sections describe the CloudWatch alarm Event Policies that are included in the *Amazon Web Services PowerPack* and information about configuring CloudWatch and SL1 to generate events based on CloudWatch alarms:

<i>CloudWatch Alarm Event Policies</i>	62
<i>Creating Custom CloudWatch Metrics</i>	64
<i>Configuring CloudWatch to Send Alarms for a Metric</i>	67
<i>Enabling Custom Metrics Collection in SL1</i>	69
<i>Configuring the "AWS CloudWatch Alarms Performance" Dynamic Application</i>	69
<i>Enabling CloudWatch Alarm Events in SL1</i>	72
<i>Preserving CloudWatch Alarm Event Changes</i>	73

CloudWatch Alarm Event Policies

Amazon CloudWatch is a service that allows you to monitor your AWS resources and applications in near real-time. You can use CloudWatch to collect and track metrics, and use CloudWatch alarms to send notifications or automatically trigger changes to the resources being monitored based on rules that you define.

In addition to SL1 collecting metrics for AWS instances, you can configure CloudWatch to send alarm information to SL1 via API. SL1 can then generate an event for each alarm.

The *Amazon Web Services PowerPack* includes an "AWS CloudWatch Alarms Performance" Dynamic Application. This Dynamic application monitors CloudWatch alarms and associates the alarms with the appropriate AWS component devices, if applicable. If an appropriate component device does not exist in SL1 or cannot be determined, the alarm is instead associated with the component device for the AWS account.

CAUTION: The performance data collected by the "AWS CloudWatch Alarms Performance" Dynamic Application is metadata intended to give general insight into the alarm activity the Dynamic Application is processing. This metadata can help identify overall trends, but users should be cautioned that the data presented can be imprecise in certain scenarios, such as when the Dynamic Application is being run in debug mode while data is still being collected.

The *Amazon Web Services PowerPack* also includes several pre-defined event policies for CloudWatch alarms:

Event Policy Name	Description	Event Source	Severity
AWS: CloudWatchAlarm_Action_Failed	An Amazon CloudWatch alarm action has failed.	API	Major
AWS: CloudWatchAlarm_Action_InProgress	An Amazon CloudWatch alarm action is in progress.	API	Notice
AWS: CloudWatchAlarm_Action_Succeeded	An Amazon CloudWatch alarm action has succeeded.	API	Notice
AWS: CloudWatchAlarm_ConfigurationUpdate	A ConfigurationUpdate alarm type is received.	API	Notice
AWS: CloudWatchAlarm_StateUpdate_Alarm	A CloudWatch alarm transitions to an "Alarm" state.	API	Major
AWS: CloudWatchAlarm_StateUpdate_InsufficientData	A CloudWatch alarm transitions to an "Insufficient Data" state.	API	Notice
AWS: CloudWatchAlarm_StateUpdate_OK	A CloudWatch alarm transitions to an "OK" state.	API	Healthy

These events are aligned to AWS Account component devices in the following way:

- If the CloudWatch alarm is configured on a device that is discovered in SL1, then the event in SL1 will be aligned with the component device for that instance.
- If the CloudWatch alarm is configured on a device that is either not discovered or not supported by CloudWatch, or if SL1 cannot determine a correct component device, then that alarm will be aligned to the Account component device.

The "AWS CloudWatch Alarms Performance" Dynamic Application and related Event Policies are disabled by default. If you want SL1 to monitor CloudWatch alarms and generate events about them, you must enable the Dynamic Application and Event Policies. You must also configure the Dynamic Application to specify which types of alarms you want to monitor.

For more information about enabling and configuring the "AWS CloudWatch Alarms Performance" Dynamic Application, see the [Configuring the "AWS CloudWatch Alarms Performance" Dynamic Application](#) section. For more information about enabling the CloudWatch alarms Event Policies, see the [Enabling CloudWatch Alarm Events in the ScienceLogic Platform](#) section.

NOTE: Because the AWS services make new data points available at varying time intervals, there might be a difference in the data points collected by SL1 when compared to data presented in CloudWatch at a given time. The difference between SL1 and CloudWatch is typically less than 1%.

NOTE: If an event expires and the CloudWatch alarm in AWS is still in an "Alarm" state, SL1 will not generate any additional CloudWatch events unless that CloudWatch alarm changes states in AWS.

Creating Custom CloudWatch Metrics

A CloudWatch alarm watches a single metric and performs one or more actions based on the value of the metric relative to a threshold over a number of time periods. A CloudWatch metric consists of the following elements:

- A **namespace**, such as *AWS/EC2*
- A **metric name**, such as *CPUUtilization*
- A **value**, such as *42*
- A **dimension** that identifies a particular resource instance, such as `{'Name': 'InstanceId', 'Value': 'i-0a6a989bb8d57b074'}`

NOTE: For a complete list of supported CloudWatch Metrics and Dimensions, see https://docs.aws.amazon.com/AmazonCloudWatch/latest/monitoring/CW_Support_For_AWS.html.

The Amazon Web Services PowerPack uses the metric dimensions identified in an alarm to associate the alarm message to a particular ScienceLogic component device. The following table lists the services that are currently supported and the dimensions used to associate an alarm to a component device:

AWS Service	Dimension
API Gateway	'ApiName' 'ApiName Stage' NOTE: ScienceLogic recommends that you create API Gateways with unique names within the same region.
ApplicationELB	'LoadBalancer' 'TargetGroup'
CloudFront	'DistributionId'
Direct Connect	'ConnectionID'
DynamoDB	'TableName'
EBS	'VolumeId'
ECS	'ClusterName' 'ServiceName'
EC2	'InstanceId' 'AutoScalingGroupName'
EKS Cluster	'ClusterName'
ElasticBeanstalk	'EnvironmentName'
ElastiCache	'CacheClusterId' NOTE: Alarms for this service will be associated with the component device for the AWS account.
ElasticMapReduce	'JobFlowId'
ELB	'LoadBalancerName'
Glacier	'VaultId' NOTE: This service is not supported by CloudWatch. You must define a custom metric and publish the metric to the CloudWatch service using an agent toolkit or the AWS command-line interface.
Lambda	'FunctionName', 'Resource', 'Version', 'Alias', 'Executed Version' NOTE: Alarms "across all functions" for this service will be associated with the component device for the AWS account. Alarms "by function name" will be aligned to a specific Lambda function.
NetworkELB	'LoadBalancer' 'TargetGroup'
OpsWorks	'StackId' 'InstanceId'
RDS	'DBInstanceIdentifier' NOTE: Alarms for this service will be associated with the component device for the AWS account.
Redshift	'ClusterIdentifier' NOTE: Alarms for this service will be associated with the component device for the AWS account.
Route53	'HealthCheckId'

AWS Service	Dimension
Shield	'ShieldService' NOTE: CloudWatch alarms are available only for Shield Advanced Services.
SNS	'TopicName'
SQS	'QueueName'
StorageGateway	'GatewayId' 'VolumeId'
S3	'BucketName'
WAF	'WebACLId'

AWS enables users to create custom metrics for these services and then publish those metrics to CloudWatch using the AWS command-line interface (CLI) or an application programming interface (API). The Dynamic Applications in the *Amazon Web Services PowerPack* can then collect data for these custom AWS metrics (which are not in the "AWS" cloud namespace).

NOTE: For the *Amazon Web Services PowerPack* to collect data for these custom metrics, you must enable certain Dynamic Applications that are disabled by default. For more information, see the [Enabling Custom Metrics Collection in the ScienceLogic Platform](#) section.

When creating a custom metric, it is important that the metric is correctly formed. For SL1 to align a custom metric to a particular ScienceLogic component device, the following must be true:

- The metric namespace must include the service being tracked.

For example, *MyVendorName/EC2* would be a valid namespace that the *Amazon Web Services PowerPack* could use to identify the EC2 service for a tracked metric.

- The dimension must include one or more of the dimensions listed in the preceding table. The dimension enables SL1 to identify which device to associate with the alarm.

For example, if the dimension included `{'Name': 'InstanceId', 'Value': 'i-0a6a989bb8d57b074'}`, this would identify the EC2 component. Other dimensions are permitted, but 'InstanceId' is necessary to locate the EC2 instance.

If the component device was an AutoScaleGroup component that is also under the EC2 service, then the dimension might look like this: `{'Name': 'AutoScalingGroupName', 'Value': 'Y1Z55ZJ390UP'}`.

NOTE: If the CloudWatch event cannot align to a particular ScienceLogic component device, it will instead align to the component device for the AWS account.

Configuring CloudWatch to Send Alarms for a Metric

To configure CloudWatch to send alarms to SL1 for a metric, perform the following steps:

1. Open a browser session and go to aws.amazon.com.
2. Click **[My Account]** and then select *AWS Management Console*. If you are not currently logged in to the AWS site, you will be prompted to log in:

A screenshot of the AWS sign-in page. At the top left is the Amazon Web Services logo. The main heading is "Sign In or Create an AWS Account". Below this, it asks "What is your e-mail or mobile number?" and provides a text input field. There are two radio buttons: "I am a new user." and "I am a returning user and my password is:". The second option is selected. Below the radio buttons is another text input field for the password. A button labeled "Sign in using our secure server" with a right-pointing arrow is next to the password field. Below the button is a link "Forgot your password?". To the right of the sign-in form is a promotional banner for "Amazon Aurora" with the text "Now Available", "Enterprise-class database at 1/10th the cost", and a "Learn more" button. At the bottom, there is a section titled "About Amazon.com Sign In" with a paragraph of text and links to "Terms of Use" and "Privacy Policy". The footer includes the copyright notice "© 1996-2015, Amazon.com, Inc. or its affiliates" and the text "An amazon.com company".

3. In the **AWS Management Console**, under the **Management Tools** heading, click **[CloudWatch]**.
4. Click the **[Browse Metrics]** button.
5. Select the metric for which you want CloudWatch to send alarms.
6. Select the instances for which you want CloudWatch to send alarms for this metric.

- Click the **[Create Alarm]** button. The **Create Alarm** page is displayed:

Create Alarm

1. Select Metric 2. Define Alarm

Alarm Threshold

Provide the details and threshold for your alarm. Use the graph on the right to help set the appropriate threshold.

Name:

Description:

Whenever: CPUUtilization

is:

for: consecutive period(s)

Alarm Preview

This alarm will trigger when the blue line goes up to or above the red line for a duration of 5 minutes

CPUUtilization >= 0

Namespace: AWS/EC2

InstanceId:

InstanceName: student13

Metric Name:

Period:

Statistic:

Actions

Define what actions are taken when your alarm changes state.

Notification [Delete](#)

Whenever this alarm:

Send notification to: [New list](#) [Enter list](#) [?](#)

[+ Notification](#) [+ AutoScaling Action](#) [+ EC2 Action](#)

[Cancel](#) [Back](#) [Next](#) [Create Alarm](#)

- Specify a Name and Description for the alarm.
- If you have previously configured an alarm for SL1, select the notification list for SL1 in the **Send notification to** field. Otherwise, select the **[New list]** link to the right of the **Send notification to** field and supply values in the following fields:
 - Send notification to.** Enter a name for the new notification list. If you add additional alarms, you can select the name you enter in this field instead of re-entering the email address.
 - Email list.** Enter the email address to which you want CloudWatch notifications sent.
- Supply values in the other fields in this page as desired.
- Click the **[Create Alarm]** button.
- Log in to the email account you configured to receive email from the email alias.
- Open the confirmation email from Amazon and click the **[Confirm subscription]** link.

Enabling Custom Metrics Collection in SL1

AWS enables users to publish their own custom metrics to CloudWatch using the AWS command-line interface (CLI) or an application programming interface (API). The *Amazon Web Services PowerPack* includes Dynamic Applications that collect data for custom AWS metrics (which are not in the "AWS" cloud namespace). However, these Dynamic Applications are disabled by default and must be enabled for use.

To enable these Dynamic Applications:

1. Go to the **Dynamic Applications Manager** page (System > Manage > Applications).
2. Click the wrench icon () for the "AWS Custom Metrics" Dynamic Application. The **Dynamic Applications Properties Editor** page appears.
3. In the **Operational State** field, select *Enabled*.
4. Click the **[Save]** button.
5. Repeat steps 1 - 4 for the "AWS Custom Metrics Cache" Dynamic Application.

Configuring the "AWS CloudWatch Alarms Performance" Dynamic Application

The *Amazon Web Services PowerPack* includes an "AWS CloudWatch Alarms Performance" Dynamic Application that monitors CloudWatch alarms and associates the alarms with the appropriate AWS component devices, if applicable. This Dynamic Application must be enabled if you want SL1 to generate CloudWatch alarm events.

NOTE: If an appropriate component device does not exist in SL1 or cannot be determined, the alarm is instead associated with the "Account" component device.
--

To enable the "AWS CloudWatch Alarms Performance" Dynamic Application:

1. Go to the **Dynamic Applications Manager** page (System > Manage > Applications).

2. Locate the "AWS CloudWatch Alarms Performance" Dynamic Application and then click its wrench icon (). The **Dynamic Applications Properties Editor** page appears.

The screenshot shows the "Dynamic Applications Properties Editor" for the application "AWS CloudWatch Alarms Performance". The interface includes a top navigation bar with tabs: Close, Properties (selected), Collections, Presentations, Snippets, Thresholds, Alerts, and Subscribers. Below the navigation bar, there are several configuration sections:

- Application Name:** AWS CloudWatch Alarms Performance
- Application Type:** [Snippet Performance]
- Caching:** [No caching]
- Device Dashboard:** None
- Version Number:** [Version 1.0]
- Operational State:** Enabled (highlighted with a red box)
- Poll Frequency:** [Every 1 Minute]
- Abandon Collection:** [Default]
- Context:** [Empty field]
- Null Row Option:** [-- values]
- Null Column Option:** [-- values]
- Disable Rollup of Data:** ☐
- Component Mapping:** ☐

Buttons for "Save" and "Save As" are located on the right side. Below the configuration sections, there is a "Description" field containing the text: "This dynamic application monitors Amazon Web Service Cloudwatch Alarms performance information." At the bottom, there is a "Release Notes & Change Log" section with a rich text editor toolbar and the following content:

Version 1.0:
1. Initial Version

Copyright (c) 2003-2018 ScienceLogic, Inc.

This software is the copyrighted work of ScienceLogic, Inc. Use of the Software is governed by the terms of the software license agreement, which accompanies or is included with the Software ("License Agreement"). An end user is not permitted to install any Software that is accompanied by or includes a License Agreement, unless he or she first agrees to the License Agreement terms.

3. In the **Operational State** field, select *Enabled*.
4. Click **[Save]**.

By default, the "AWS CloudWatch Alarms Performance" Dynamic Application monitors only the "StateUpdate" type of CloudWatch alarms. If you want the Dynamic Application to also monitor "Action" and "ConfigurationUpdate" alarm types, you must configure the Dynamic Application to do so.

To configure the "AWS CloudWatch Alarms Performance" Dynamic Application to monitor all CloudWatch alarm types:

1. Go to the **Dynamic Applications Manager** page (System > Manage > Applications).
2. Locate the "AWS CloudWatch Alarms Performance" Dynamic Application and then click its wrench icon (). The **Dynamic Applications Properties Editor** page appears.
3. Click the **[Collections]** tab. The **Collection Objects** page appears.

- On the **Collection Objects** page, locate the "CloudWatch Alarms Collection Success" collection object and then click its wrench icon ().

Dynamic Applications [1429] | Collection Objects

Object Name: CloudWatch Alarms Collection Success

Snippet Arguments: alarms_success

Class Type: [4 Performance Gauge]

Snippet: [cloudwatch_alarms_performance]

Group / Usage Type: [No Group] / [Standard]

Enable Deviation Alerting: ☐ max weeks data: 0 min weeks data: 0

Description: Indicates the success (1) or failure (0) of the CloudWatch alarms history collection snippet. Failure (0) occurs if the snippet encounters an unexpected error. NOTE: This collection object is especially important for determining which CloudWatch alarms are to be monitored. 1. To collect all CloudWatch alarm types (ConfigurationUpdate, StateUpdate, Action), select the snippet cloudwatch_alarms_performance. 2. To collect only CloudWatch StateUpdate alarm types, select the snippet cloudwatch_alarms_performance.StateUpdate only.

Formula:

Save Save As ☐ Disable Object Maintenance

Collection Object Registry

	Object Name	Class Type	Class ID	Snippet Arguments	Group	ID	Edit Date	
1.	CloudWatch Action (Failed) Alarms	Performance Gauge	4	action_failure_type_count	--	o_16666	2018-04-19 13:55:56	☐
2.	CloudWatch Action Alarms	Performance Gauge	4	action_type_count	--	o_16663	2018-04-19 13:55:56	☐
3.	CloudWatch Alarms	Performance Gauge	4	total_alarm_count	--	o_16659	2018-04-19 13:55:56	☐
4.	CloudWatch Alarms Collection Success	Performance Gauge	4	alarms_success	--	o_16667	2018-04-19 14:58:23	☐

10.	CloudWatch Total Alarms	Performance Gauge	4	aggregate_alarm_count	--	o_16668	2018-04-19 13:55:56	☐

[Select Action] Go

- In the **Snippet** field, select `cloudwatch_alarms_performance`.

NOTE: If you want to revert back to monitoring only the "StateUpdate" CloudWatch alarms, then select `cloudwatch_alarms_performance.StateUpdate_only` in the **Snippet** field.

- Click **[Save]**.

Enabling CloudWatch Alarm Events in SL1

The Amazon Web Services PowerPack also includes several pre-defined event policies for CloudWatch alarms. These Event Policies must be enabled if you want SL1 to generate CloudWatch alarm events.

To enable the CloudWatch alarms Event Policies:

1. Go to the **Event Policies** page (Events > Event Policies).
2. Perform a search for "CloudWatch".

3. Select the check boxes for the events you want to enable.
4. Select **Enable** at the bottom of the screen.

To enable the CloudWatch alarms Event Policies in the SL1 classic user interface:

1. Go to the **Event Policy Manager** page (Registry > Events > Event Manager).

2. In the **Event Policy Name** filter-while-you-type field, type "CloudWatch".

Event Policy Manager | Policies Found [7]

	Event Policy Name	Type	State	P-Pack	Severity	Weight	ID	Expiry	Time	Thresh	Edited By	Last Edited	External ID	Ext. Category	
1.	AWS: CloudWatchAlarm_Action_Failed	API	Enabled	Yes	Major	0	4234	90 Min.	0 Min.	0	em7admin	2018-04-17 09:56:26	--	--	☒

[Select Action]
Administration:
[DELETE these Event Policies]
[ENABLE these Event Policies]
[DISABLE these Event Policies]
[CLEAR the Suppression List]
[Select Action] Go

3. Select the check boxes for the events you want to enable.
4. In the **Select Action** drop-down field, select **ENABLE these Event Policies**.
5. Click **[Go]**.

Preserving CloudWatch Alarm Event Changes

If you have modified CloudWatch alarm event policies that are included in the Amazon Web Services PowerPack, those changes will be overwritten when the PowerPack is updated in your system. If you have modified event policies that are included in the PowerPack, you can:

- Re-implement those changes after each update of the Amazon Web Services PowerPack.
- Remove the content from the PowerPack on your system. When the Amazon Web Services PowerPack is updated in your system, updated versions of this content will not be installed on your system and your local changes will be preserved.

To remove event policies from the Amazon Web Services PowerPack on your system:

1. Go to the **PowerPack Manager** page (System > Manage > PowerPacks).
2. Click the wrench icon (🔧) for the Amazon Web Services PowerPack. The **Editing PowerPack** page appears.
3. In the left NavBar of the **Editing PowerPack** page, click **[Event Policies]**. The **Embedded Event Policies** and **Available Event Policies** panes appear.
4. In the upper pane, click the bomb icon (💣) for each event policy that you want to remove from the Amazon Web Services PowerPack on your system.

AWS Billing Report – Control

Description:	AWS Billing
Report Version:	1.1
Generated On:	2015/04/17 07:46:56
AWS Accounts:	All
Start Date:	2014/04
Duration:	To present

Generated on: 2015/04/17 07:46:56

The following input options are available when generating the report:

- **AWS Accounts.** Select the AWS Account(s) for which you want to generate the report. The *All Accounts* checkbox is selected by default. De-selecting this checkbox allows you to select one or more specific accounts for which to generate a report.
- **Report Span.** Select a span from one to 36 months for the report, or specify a specific starting date for the report.

This description covers the latest version of this report as shipped by ScienceLogic. This report might have been modified on your SL1 system.

AWS Inventory Report

This report displays an inventory of AWS instance counts. The report includes the number of each kind of instance in every zone associated with the chosen accounts. It also includes a count of each EC2 instance size in each zone.

Generated on: April 17th, 2015 at 7:46am

The following input options are available when generating the report:

- **Organizations.** Select the organization for which you want to generate the report. The *All Organizations* checkbox is selected by default. De-selecting this checkbox allows you to select one or more specific organizations for which to generate a report.
- **AWS Accounts.** Select the AWS Account(s) for which you want to generate the report. The *All Accounts* checkbox is selected by default. De-selecting this checkbox allows you to select one or more specific accounts for which to generate a report.
- **Filter on EC2 Instance Config Data.** Select the EC2 instances that will be included in the report based on the configuration data reported for each EC2 instance:
 - Choose up to four configuration parameters for EC2 instances.
 - For each selected configuration parameter, enter a value to match against and select how that value should be matched.
 - In the **Comparison Operator** field, select whether an EC2 instance must match all configuration parameters (*and*) or only one configuration parameter (*or*) to be included on the report.
- **Report Options.** Select the *Include Terminated Instances* checkbox to include all terminated instances.

This description covers the latest version of this report as shipped by ScienceLogic. This report might have been modified on your SL1 system.

AWS Running Config Report

This report displays the running config of all AWS instances for one to all organizations across a number of AWS billing accounts.

Dashboards

Overview

The following sections describe how to install the *Amazon Web Services: Classic Dashboards* PowerPack and a description of each dashboard that is included in the PowerPack:

<i>Installing the Amazon Web Services: Classic Dashboards PowerPack</i>	81
<i>AWS Account Billing Dashboard</i>	83
<i>AWS Health Status Dashboard</i>	84
<i>AWS Service Instance Performance Dashboards</i>	84

Installing the Amazon Web Services: Classic Dashboards PowerPack

To view the Amazon Web Services dashboards in SL1, you must first install the *Amazon Web Services: Classic Dashboards* PowerPack.

NOTE: The AWS dashboards have a default **Access Control** setting of "Private", which means they can be viewed only by an administrator. For more information about dashboard access settings, see the **Dashboards** manual.

To install the PowerPack:

1. Go to the **PowerPack Manager** page (System > Manage > PowerPacks).
2. Click the **[Actions]** button, then select *Install PowerPack*. The **Imported PowerPacks** modal page appears.

- Use the search filter in the **PowerPack Name** column heading to locate the PowerPack you want to install. To do so, enter text to match, including special characters, and the **Imported PowerPacks** modal page displays only PowerPacks that have a matching name.

- Click the lightning-bolt icon (⚡) for the PowerPack that you want to install.
- The **Install PowerPack** modal page appears. To install the PowerPack, click **[Install]**.

- The PowerPack now appears in the **PowerPack Manager** page. The contents of the PowerPack are automatically installed in your SL1 System.

AWS Account Billing Dashboard

The AWS Account Billing Dashboard displays:

- A pie chart that shows the estimated billing amount for each service over the selected time period.
- A performance graph that shows the estimated billing amount for the selected service, over time. To select a service, click on the pie-chart segment for that service.
- A table that shows the currently active AWS events.
- A time span selector that controls the amount of data shown in the pie chart and the performance graph.
- An organization selector that limits the data in the pie chart and performance graph to include only instances associated with the selected organizations.

AWS Health Status Dashboard

The AWS Health Status Dashboard displays:

[illegible]

- A traffic light widget that displays a list of AWS services. To populate the other widgets in this dashboard, select a service.
- A tear-sheet widget that displays information and links for the selected service.
- A service health widget, that displays log messages about the health of the service.
- A table that displays currently active events for the service.
- An organization selector and a device group selector that control which services are shown in the traffic light widget.

AWS Service Instance Performance Dashboards

The *Amazon Web Services: Classic Dashboards* PowerPack includes a dashboard for each service type. Each dashboard displays performance metrics for instances of an AWS service. The following dashboards are included:

- AWS Application ELB Performance
- AWS Classic ELB Performance
- AWS DDB Performance
- AWS EBS Performance
- AWS EC2 Performance
- AWS EMR Performance
- AWS Network ELB Performance
- AWS RDS Performance

- AWS SQS Performance
- AWS Storage Gateway Performance

Each performance dashboard includes:

- A traffic light widget that shows the status of all instances for the service.
- Four performance graphs that show applicable metrics when you select an instance from the traffic light widget.
- A time span selector that controls the amount of data shown in the performance graphs.
- An organization selector and device group selector that control which instances are shown in the traffic light widget.

Run Book Actions and Automations

Overview

The following sections describe the Run Book Action and Automation policies that are included in the Amazon Web Services PowerPack and how to use them:

<i>About the Run Book Actions and Automations</i>	87
<i>Disabling EC2 and EBS Instances by EC2 Tag</i>	88
<i>Modifying the Parameters of the Automation Actions</i>	89
<i>Enabling the Component Device Record Created Event Policy</i>	89
<i>Enabling the Automation Policies</i>	90
<i>Preserving Automation Changes</i>	90
<i>Discovering EC2 Instances by Public or Private IP Address</i>	91
<i>Modifying the Parameters of the Automation Actions</i>	92
<i>Enabling the Component Device Record Created Event Policy</i>	94
<i>Enabling the Device Record Created Event Policy</i>	94
<i>Enabling the Automation Policies</i>	95
<i>Preserving Automation Changes</i>	95
<i>Aligning AWS Regions to the AWS Region Device Class</i>	96
<i>Vanishing Terminated or Terminating EC2 Instances</i>	96
<i>Enabling the Automation Policies</i>	97
<i>Preserving Automation Changes</i>	97

About the Run Book Actions and Automations

The Amazon Web Services PowerPack includes Run Book Action and Automation policies that can be used to:

- Automatically disable EC2 and EBS devices based on EC2 tags collected from AWS
- Automatically create and start a discovery session for the public or private IP address of an EC2 instance after a component and physical device are merged
- Automatically move an EC2 instance to a vanished state if the EC2 instance is in a terminating or terminated state
- Align AWS region device classes with the correct AWS Region

The following table describes the automation policies and what they do:

Policy Name	Result
AWS: Disable EBS Instances by EC2 Tag	If a component device belongs to the AWS EBS Volumes device group and has an EC2 tag, SL1 disables the device.
AWS: Disable EC2 and EBS Instances by EC2 Tag	If a component device belongs to either the AWS EBS Volumes or AWS EC2 Instances device group and has an EC2 tag, SL1 disables the device.
AWS: Disable or Discover EC2 Instances	SL1 automatically discovers EC2 instances by public or private IP address. Additionally, if a component device belongs to the AWS EC2 Instances device group and has an EC2 tag, SL1 disables the device.
AWS: Discover EC2 Instances	SL1 automatically discovers EC2 instances by public or private IP address.
AWS: Merge with EC2	If SL1 determines that the IP address of a physical device matches a custom attribute added to an EC2 Instance component device, SL1 merges the devices.
AWS: Region Device Class Alignment	If a Region is aligned to an incorrect Region device class, SL1 will align the Region to the correct device class.
AWS: Vanish Terminated EC2 Instances	If a device belongs to the AWS EC2 Instances device group and is in a terminated or terminating state, SL1 un-merges the EC2 Instance and physical device (if applicable), clears the device's associated events, and then moves the device to a vanished state.

NOTE: The automation policies in the Amazon Web Services PowerPack are disabled by default. To use these automations, you must enable the automation policies and optionally modify the parameters in the automation actions.

NOTE: To use the automation policies in the *Amazon Web Services PowerPack*, the AWS EBS Volumes and AWS EC2 Instances device groups must already be created and populated.

Disabling EC2 and EBS Instances by EC2 Tag

The automation for disabling EC2 and EBS instances includes two automation actions that are executed in the following order:

- **AWS: Get EC2 Instance Configuration.** This action requests information from the AWS API about the EC2 instance that triggered the automation action or the EC2 instance associated with the EBS instance that triggered the automation action. Information about the EC2 instance associated with an EBS instance is returned only if one EC2 instance is associated with the EBS instance.
- **AWS: Disable Instance By Tag.** This action compares the information collected by the **AWS: Get EC2 Instance Configuration** automation action with a pre-defined list of key/value pairs. If an AWS tag matches a key/value pair, the triggering device is disabled.

The *Amazon Web Services PowerPack* includes three automation policies that trigger these actions:

- **AWS: Disable EC2 and EBS Instances by EC2 Tag.** If enabled, this automation policy can trigger for any device with which the "AWS EC2 Instance Configuration" or the "AWS EBS Instance Configuration" Dynamic Applications are aligned (the members of the AWS EC2 Instances and AWS EBS Volumes device groups). The automation policy triggers when the "Component Device Record Created" event is active on the matching devices, immediately after the devices are discovered in the system. Enable this automation policy if you want to disable EC2 and EBS instances by EC2 tag, but do not want to enable automated discovery of EC2 instances by public or private IP address.
- **AWS: Disable or Discover EC2 Instances.** If enabled, this automation policy can trigger for any device with which the "AWS EC2 Instance Configuration" Dynamic Application is aligned (the members of the AWS EC2 Instances). The automation policy triggers when the "Component Device Record Created" event is active on the matching devices, immediately after the devices are discovered in the system. Enable this automation policy if you want to disable EC2 instances by EC2 tag *and* want to enable automated discovery of EC2 instances by public or private IP address. This automation policy is configured to run both processes in the correct order for EC2 instances. If you enable this automation policy and want to automatically disable associated EBS instances, you must also enable the **AWS: Disable EBS Instances by EC2 Tag** automation policy.
- **AWS: Disable EBS Instances by EC2 Tag.** If enabled, this automation policy can trigger for any device with which the "AWS EC2 Instance Configuration" Dynamic Application is aligned (the members of the AWS EC2 Instances). The automation policy triggers when the "Component Device Record Created" event is active on the matching devices, immediately after the devices are discovered in the system. Enable this automation policy if you want to disable EC2 instances by EC2 tag, want to enable automated discovery of EC2 instances by public or private IP address, and want to disable EBS instances by EC2 tag.

To use this automation, you must:

- [Modify the parameters of the automation actions \(optional\)](#)
- [Enable the Component Device Record Created event policy](#)
- [Enable the automation policies](#)
- [Configure your system to preserve these changes](#)

Modifying the Parameters of the Automation Actions

The snippet for the **AWS: Disable EBS Instances by EC2 Tag** automation action includes the pre-defined list of key/value pairs with which the tags collected from the AWS API are compared. You must modify this list to include the key/value pairs that you want to use to disable EC2 instances.

To modify the parameters for the **AWS: Disable EBS Instances by EC2 Tag** automation action:

1. Go to the **Action Policy Manager** page (Registry > Run Book > Actions).
2. Click the wrench icon () for the **AWS: Disable Instance By Tag** automation action.
3. In the **Snippet Code** field, locate and edit the following line:

```
DISABLE_TAGS = [('ExampleKey', 'ExampleValue')]
```

The line must be in the following format, with each key and each value inside single-quotes and each key/value pair comma-separated inside parentheses, with commas separating each key/value pair.

```
DISABLE_TAGS = [('Key', 'Value'), ('Key', 'Value'), ..., ('Key', 'Value')]
```

For example, suppose you want to disable an EC2 instance where the "Environment" key is either "dev" or "test" or the "Owner" key is "Sales". You would update the line so it looks like this:

```
DISABLE_TAGS = [('Environment', 'dev'), ('Environment', 'test'), ('Owner', 'Sales')]
```

4. Click the **[Save]** button.

Enabling the Component Device Record Created Event Policy

To enable the "Component Device Record Created" event policy:

1. Go to the **Event Policies** page (Events > Event Policies).
2. Click the Actions menu () for the "Component Device Record Created" event policy and select *Edit*.
3. In the **Event Policy Editor** page, click on the **Enable Event Policy** toggle to enable the event policy.
4. Click **[Save]**.

To enable the "Component Device Record Created" event policy in the SL1 classic user interface:

1. Go to the **Event Policy Manager** page (Registry > Events > Event Manager).
2. Click the wrench icon () for the "Component Device Record Created" event policy.

3. In the **Operational State** field, select *Enabled*.
4. Click **[Save]**.

To prevent this change from being overwritten when the PowerPacks installed on the system are updated, you can enable the **Selective PowerPack Field Protection** option. To enable this option:

1. Go to the **Behavior Settings** page (System > Settings > Behavior).
2. Check the **Enable Selective PowerPack Field Protection** checkbox.
3. Click **[Save]**.

Enabling the Automation Policies

To enable one or more automation policies in the *Amazon Web Services* PowerPack:

1. Go to the **Automation Policy Manager** page (Registry > Run Book > Automation).
2. Click the wrench icon () for the automation policy you want to enable.
3. In the **Policy State** field, select *Enabled*.
4. Click **[Save]**.

Preserving Automation Changes

If you have modified automation actions and policies that are included in the *Amazon Web Services* PowerPack, those changes will be overwritten when the PowerPack is updated in your system. If you have modified automation actions and policies that are included in the PowerPack, you can:

- Re-implement those changes after each update of the *Amazon Web Services* PowerPack.
- Remove the content from the PowerPack on your system. When the *Amazon Web Services* PowerPack is updated in your system, updated versions of this content will not be installed on your system and your local changes will be preserved.

To remove automation actions or automation policies content from the *Amazon Web Services* PowerPack on your system:

1. Go to the **PowerPack Manager** page (System > Manage > PowerPacks).
2. Click the wrench icon () for the *Amazon Web Services* PowerPack. The **Editing PowerPack** page appears.
3. In the left NavBar of the **Editing PowerPack** page, select the type of content you want to remove:
 - To remove an automation action, click **Run Book Actions**. The **Embedded Run Book Actions** and **Available Run Book Actions** panes appear.
 - To remove an automation policy, click **Run Book Policies**. The **Embedded Run Book Policies** and **Available Run Book Policies** panes appear.
4. In the upper pane, click the bomb icon () for each automation action or automation policy that you want to remove from the *Amazon Web Services* PowerPack on your system.

Discovering EC2 Instances by Public or Private IP Address

The automation for discovering EC2 instances by public or private IP addresses includes three automation actions that are executed in the following order:

- **AWS: Get EC2 Instance Configuration.** This action requests information from the AWS API about the EC2 instance that triggered the automation action.
- **AWS: Discover from EC2 IP.** This action uses the IP address and port information in the response from the AWS API to create and run a discovery session. This action also adds a custom attribute to the EC2 component device record that can be used to match a newly discovered device to the EC2 instance.
- **AWS: Merge Physical with Component.** This action matches the IP address of a physical device with the custom attribute added to EC2 component devices by the **AWS: Discover from EC2 IP** automation action. If a match is found, the matching EC2 component device is merged with the physical device.

The Amazon Web Services PowerPack includes three automation policies that trigger these actions:

- **AWS: Discover EC2 Instances.** If enabled, this automation policy can trigger for any device with which the "AWS EC2 Instance Configuration" Dynamic Application is aligned (the members of the AWS EC2 Instances). The automation policy triggers when the "Component Device Record Created" event is active on the matching devices, immediately after the devices are discovered in the system. Enable this automation policy if you want to enable automated discovery of EC2 instances by public or private IP address but do not want disable EC2 and EBS instances by EC2 tag.
- **AWS: Disable or Discover EC2 Instances.** If enabled, this automation policy can trigger for any device with which the "AWS EC2 Instance Configuration" Dynamic Application is aligned (the members of the AWS EC2 Instances). The automation policy triggers when the "Component Device Record Created" event is active on the matching devices, immediately after the devices are discovered in the system. Enable this automation policy if you want to disable EC2 instances by EC2 tag **and** want to enable automated discovery of EC2 instances by public or private IP address. This automation policy is configured to run both in the correct order for EC2 instances.
- **AWS: Merge with EC2.** If enabled, this automation policy can trigger for any device. The automation policy triggers when the "Device Record Created" event is active on the matching devices, immediately after the devices are discovered in the system. Enable this automation policy if you want to enable automated discovery of EC2 instances by public or private IP address.

To use this automation, you must:

- [Modify the parameters of the automation actions \(optional\)](#)
- [Enable the Component Device Record Created event policy](#)
- [Enable the Device Record Created event policy](#)
- [Enable the automation policies](#)
- [Configure your system to preserve these changes](#)

Modifying the Parameters of the Automation Actions

The snippet for the **AWS: Discover from EC2 IP** automation action includes parameters that define how the automation action creates discovery sessions. You can edit the following lines in the **Snippet Code** field of the **AWS: Discover from EC2 IP** automation action to change these parameters:

- `EC2_IP_ATTRIBUTE = 'PrivateIpAddress'`

The attribute returned by the AWS API for EC2 instances that contains the IP address to use in the discovery session. By default, the private IP address is used. To use the public IP address of the EC2 instance, change this line to:

```
EC2_IP_ATTRIBUTE = 'PublicIpAddress'
```

- `EXTRA_SCAN_PORTS = ["21", "22", "23", "25", "80", "443", "5985", "5986"]`

The list of TCP ports used in the discovery session includes any TCP ports that are specified explicitly in the security group associated with the EC2 instance, plus any TCP ports included in the `EXTRA_SCAN_PORTS` parameter. You can add or remove ports from this default list. For example, if you wanted to remove TCP port 21 from this list and add TCP port 53, you would change this line to:

```
EXTRA_SCAN_PORTS = ["22", "23", "25", "53", "80", "443", "5985", "5986"]
```

NOTE: The `EXTRA_SCAN_PORTS` parameter must be populated if there are no rules for specific ports in the security group associated with the EC2 instance.

- `AUTO_INCLUDE_CREDS = True`

If the `AUTO_INCLUDE_CREDS` parameter is "True", the automation will automatically add credentials to the discovery session. A credential will be added automatically if it meets one of the following requirements:

- The credential is an SNMP credential, the Security Group associated with the EC2 instance includes a rule that allows access to UDP port 161, and the credential is explicitly aligned within the organization of the EC2 instance.
- The credential is an SNMP credential, the Security Group associated with the EC2 instance includes a rule that allows access to UDP port 161, the credential is associated with all organizations in the system, and the `INCLUDE_ALL_ORG_CREDS` parameter is "True".
- The credential is not an SNMP credential or an LDAP/AD credential, the TCP port used by the credential is included in the list of TCP ports for the discovery session (the credential is specified explicitly in the security group associated with the EC2 instance or is included in the `EXTRA_SCAN_PORTS` parameter), and the credential is explicitly aligned with in the organization of the EC2 instance.
- The credential is not an SNMP credential or an LDAP/AD credential, the TCP port used by the credential is included in the list of TCP ports for the discovery session (the credential is specified explicitly in the security group associated with the EC2 instance or is included in the `EXTRA_SCAN_PORTS` parameter), and the `INCLUDE_ALL_ORG_CREDS` parameter is "True".

To disable the automatic alignment of credentials to the discovery session, change this line to:

```
AUTO_INCLUDE_CREDS = False
```

- `INCLUDE_ALL_ORG_CREDS = True`

If `INCLUDE_ALL_ORG_CREDS` is "True" and the `AUTO_INCLUDE_CREDS` parameter is "True", credentials that are aligned with all organizations (credentials that do not have an explicit organization alignment) are automatically included in the discovery session when that credential meets the other requirements for being automatically included in the discovery session.

- `EXTRA_CREDS = ""`

In addition to the credentials that are automatically included in the discovery sessions based on open ports, you can optionally specify a string of comma-separated credential IDs for credentials that will be included in every discovery session created by this automation. For example, if you wanted to include credentials with IDs 10 and 13 in every discovery session created by this automation, you would change this line to:

```
EXTRA_CREDS = "10,13"
```

- `DISCOVER_NON_SNMP = "1"`

If `DISCOVER_NON_SNMP` is set to "1", discovery sessions created by this automation will be configured to discover non-SNMP devices. If you want the discovery sessions created by this automation to discover only SNMP devices, change this line to:

```
DISCOVER_NON_SNMP = "0"
```

- `TEMPLATE_NAME = ""`

If you specify a device template name in the `TEMPLATE_NAME` parameter, that device template will be automatically aligned with all discovery sessions created by this automation. For example, if you wanted to align a device template called "Standard Device Template" to every discovery session created by this automation, you would change this line to:

```
TEMPLATE_NAME = "Standard Device Template"
```

To modify the parameters for the **AWS: Discover from EC2 IP** automation action, perform the following steps:

1. Go to the **Action Policy Manager** page (Registry > Run Book > Actions).
2. Click the wrench icon () for the **AWS: Discover from EC2 IP** automation action.
3. In the **Snippet Code** field, locate and edit the line(s) for the parameter(s) you want to change:
4. Click the **[Save]** button.

If you modified the `EC2_IP_ATTRIBUTE` parameter in the **AWS: Discover from EC2 IP** automation action, you must perform the following steps to update the **AWS: Merge Physical with Component** automation action:

To modify the parameters for the **AWS: Discover from EC2 IP** automation action, perform the following steps:

1. Go to the **Action Policy Manager** page (Registry > Run Book > Actions).
2. Click the wrench icon () for the **AWS: Discover from EC2 IP** automation action.

3. In the **Snippet Code** field, locate and edit the following line:

```
IP_ATTRIBUTE = 'c-EC2_PrivateIpAddress'
```

If you changed the EC2_IP_ATTRIBUTE parameter in the **AWS: Discover from EC2 IP** automation action to 'PublicIpAddress', change this line to:

```
IP_ATTRIBUTE = 'c-EC2_PublicIpAddress'
```

4. Click the **[Save]** button.

Enabling the Component Device Record Created Event Policy

To enable the "Component Device Record Created" event policy:

1. Go to the **Event Policies** page (Events > Event Policies).
2. Click the Actions menu () for the "Component Device Record Created" event policy and select *Edit*.
3. In the **Event Policy Editor** page, click on the **Enable Event Policy** toggle to enable the event policy.
4. Click **[Save]**.

To enable the "Component Device Record Created" event policy in the SL1 classic user interface:

1. Go to the **Event Policy Manager** page (Registry > Events > Event Manager).
2. Click the wrench icon () for the "Component Device Record Created" event policy.
3. In the **Operational State** field, select *Enabled*.
4. Click **[Save]**.

To prevent this change from being overwritten when the PowerPacks installed on the system are updated, you can enable the **Selective PowerPack Field Protection** option. To enable this option:

1. Go to the **Behavior Settings** page (System > Settings > Behavior).
2. Check the **Enable Selective PowerPack Field Protection** checkbox.
3. Click **[Save]**.

Enabling the Device Record Created Event Policy

To enable the "Device Record Created" event policy:

1. Go to the **Event Policies** page (Events > Event Policies).
2. Click the Actions menu () for the "Device Record Created" event policy and select *Edit*.
3. In the **Event Policy Editor** page, click on the **Enable Event Policy** toggle to enable the event policy.
4. Click **[Save]**.

To enable the "Device Record Created" event policy in the SL1 classic user interface:

1. Go to the **Event Policy Manager** page (Registry > Events > Event Manager).
2. Click the wrench icon () for the "Device Record Created" event policy.
3. In the **Operational State** field, select *Enabled*.
4. Click **[Save]**.

To prevent this change from being overwritten when the PowerPacks installed on the system are updated, you can enable the **Selective PowerPack Field Protection** option. To enable this option:

1. Go to the **Behavior Settings** page (System > Settings > Behavior).
2. Check the **Enable Selective PowerPack Field Protection** checkbox.
3. Click **[Save]**.

Enabling the Automation Policies

To enable one or more automation policies in the *Amazon Web Services* PowerPack:

1. Go to the **Automation Policy Manager** page (Registry > Run Book > Automation).
2. Click the wrench icon () for the automation policy you want to enable.
3. In the **Policy State** field, select *Enabled*.
4. Click **[Save]**.

Preserving Automation Changes

If you have modified automation actions and policies that are included in the *Amazon Web Services* PowerPack, those changes will be overwritten when the PowerPack is updated in your system. If you have modified automation actions and policies that are included in the PowerPack, you can:

- Re-implement those changes after each update of the *Amazon Web Services* PowerPack.
- Remove the content from the PowerPack on your system. When the *Amazon Web Services* PowerPack is updated in your system, updated versions of this content will not be installed on your system and your local changes will be preserved.

To remove automation actions or automation policies content from the *Amazon Web Services* PowerPack on your system:

1. Go to the **PowerPack Manager** page (System > Manage > PowerPacks).
2. Click the wrench icon () for the *Amazon Web Services* PowerPack. The **Editing PowerPack** page appears.

3. In the left NavBar of the **Editing PowerPack** page, select the type of content you want to remove:
 - To remove an automation action, click **Run Book Actions**. The **Embedded Run Book Actions** and **Available Run Book Actions** panes appear.
 - To remove an automation policy, click **Run Book Policies**. The **Embedded Run Book Policies** and **Available Run Book Policies** panes appear.
4. In the upper pane, click the bomb icon (💣) for each automation action or automation policy that you want to remove from the *Amazon Web Services PowerPack* on your system.

Aligning AWS Regions to the AWS Region Device Class

The automation for aligning an AWS Region to the correct AWS Region device class includes one automation action:

- **AWS: Region Device Class Alignment**. This action updates the AWS device class to the correct AWS Region.

NOTE: Device classes for AWS Regions are updated in the second cycle of the "AWS Region Device Class Discovery" Dynamic Application. Regions will be updated after 24 hours.

The *Amazon Web Services PowerPack* includes an automation policy that triggers this action:

- **AWS: Region Device Class Alignment**. If enabled, this automation policy can trigger for any device with which the "AWS Region Device Class Discovery" Dynamic Application is aligned. The automation policy triggers when the AWS: Device Class Change event is active on the matching devices, and the automation policy will repeat every 10 minutes until that event is no longer active.

Vanishing Terminated or Terminating EC2 Instances

The automation for vanishing terminated EC2 instances includes one automation action:

- **AWS: Vanish Terminated EC2 Instances**. If an EC2 instance has been terminated in Amazon, its corresponding device in SL1 becomes unavailable. This action then requests information from the AWS API about the EC2 instance that triggered the automation action. If the response from the AWS API indicates that the EC2 instance that triggered the automation action is in a terminated or terminating state, the action performs the following steps:
 - If the automation triggers for a physical device that is merged with an EC2 instance, the devices are un-merged.
 - If the automation triggers for a physical device that is merged with an EC2 instance, after being un-merged the physical device is moved to a virtual collector group.
 - If the automation triggers for a physical device that is merged with an EC2 instance, after being unmerged, all events associated with the physical device are cleared.

- All events associated with the component device are cleared.
- The component device is vanished.

NOTE: If an EC2 instance is stopped in AWS rather than terminated, then the "AWS Vanish Terminated EC2 Instances" is not triggered.

The Amazon Web Services PowerPack includes an automation policy that triggers this action:

- **AWS: Vanish Terminated EC2 Instances.** If enabled, this automation policy can trigger for any device with which the "AWS EC2 Instance Configuration" Dynamic Application is aligned (the members of the AWS EC2 Instances). The automation policy triggers when the Availability Check Failed event is active on the matching devices, and the automation policy will repeat every 10 minutes until that event is no longer active.

To use this automation, you must:

- [Enable the AWS: Vanish Terminated EC2 Instances automation policy](#)
- [Configure your system to preserve this change](#)

Enabling the Automation Policies

To enable one or more automation policies in the Amazon Web Services PowerPack:

1. Go to the **Automation Policy Manager** page (Registry > Run Book > Automation).
2. Click the wrench icon () for the automation policy you want to enable.
3. In the **Policy State** field, select *Enabled*.
4. Click **[Save]**.

Preserving Automation Changes

If you have modified automation actions and policies that are included in the Amazon Web Services PowerPack, those changes will be overwritten when the PowerPack is updated in your system. If you have modified automation actions and policies that are included in the PowerPack, you can:

- Re-implement those changes after each update of the Amazon Web Services PowerPack.
- Remove the content from the PowerPack on your system. When the Amazon Web Services PowerPack is updated in your system, updated versions of this content will not be installed on your system and your local changes will be preserved.

To remove automation actions or automation policies content from the Amazon Web Services PowerPack on your system:

1. Go to the **PowerPack Manager** page (System > Manage > PowerPacks).
2. Click the wrench icon () for the *Amazon Web Services* PowerPack. The **Editing PowerPack** page appears.
3. In the left NavBar of the **Editing PowerPack** page, select the type of content you want to remove:
 - To remove an automation action, click **Run Book Actions**. The **Embedded Run Book Actions** and **Available Run Book Actions** panes appear.
 - To remove an automation policy, click **Run Book Policies**. The **Embedded Run Book Policies** and **Available Run Book Policies** panes appear.
4. In the upper pane, click the bomb icon () for each automation action or automation policy that you want to remove from the *Amazon Web Services* PowerPack on your system.
