Introduction

Overview

This manual describes how to monitor Cisco CloudCenter Suite services in SL1 using the Dynamic Applications in the *Cisco CloudCenter Suite PowerPack*.

NOTE: The *Cisco CloudCenter Suite PowerPack* supports Cisco CloudCenter Suite version 5.1 and higher.

The following sections provide an overview of Cisco CloudCenter Suite and the *Cisco CloudCenter Suite PowerPack*:

What is the Cisco CloudCenter Suite?	3
What Does the Cisco: CloudCenter Suite PowerPack Monitor?	4
Installing the Cisco: CloudCenter PowerPack	4

NOTE: ScienceLogic provides this documentation for the convenience of ScienceLogic customers. Some of the configuration information contained herein pertains to third-party vendor software that is subject to change without notice to ScienceLogic. ScienceLogic makes every attempt to maintain accurate technical information and cannot be held responsible for defects or changes in third-party vendor software. There is no written or implied guarantee that information contained herein will work for all third-party variants. See the End User License Agreement (EULA) for more information.

What is the Cisco CloudCenter Suite?

Cisco CloudCenter Suite is a comprehensive, enterprise-class multicloud orchestration and workflow management platform used for deploying and managing infrastructure and applications in data centers, private

clouds, and public clouds. Cisco CloudCenter Suite 5.1 includes Cisco CloudCenter, now known as Workload Manager.

What Does the Cisco: CloudCenter Suite PowerPack Monitor?

The *Cisco CloudCenter Suite* PowerPack lets you discover and collect configuration and performance data about CloudCenter Suite 5.1 deployments and their components. The *Cisco CloudCenter Suite* PowerPack can monitor CloudCenter Manager version 5.1 and higher.

The *Cisco CloudCenter Suite* PowerPack includes:

- A sample Credential you can use as a template to create your own Credentials to monitor CloudCenter Suite deployments
- Dynamic Applications and Run Book Actions to discover, model, and monitor performance metrics and/or collect configuration data for the following CloudCenter Suite components:
 - CloudCenter Suite Action Orchestrator
 - CloudCenter Suite Workload Manager
 - CloudCenter Suite Cost Optimizer
 - Supported CloudCenter Suite Applications
- Device Classes for each of the CloudCenter Suite components that SL1 monitors
- Event Policies and corresponding alerts that are triggered when CloudCenter Suite components meet certain status criteria
- Automation policies you can use to specify actions you want to run automatically in response to specific event conditions in SL1

Installing the Cisco: CloudCenter PowerPack

Before completing the steps in this manual, you must import and install the latest version of the *Cisco CloudCenter Suite* PowerPack.

NOTE: To align RabbitMQ with your Remote Cloud, you must install the Docker PowerPack discover the swarm. You must also have the AMQP: RabbitMQ PowerPack installed.

TIP: By default, installing a new version of a PowerPack overwrites all content from a previous version of that PowerPack that has already been installed on the target system. You can use the **Enable Selective PowerPack Field Protection** setting in the **Behavior Settings** page (System > Settings > Behavior) to prevent new PowerPacks from overwriting local changes for some commonly customized fields. (For more information, see the **System Administration** manual.)

IMPORTANT: The minimum required MySQL version is 5.6.0.

To download and install the PowerPack:

1. Search for and download the PowerPack from the **PowerPacks** page (Product Downloads > PowerPacks & SyncPacks) at the [ScienceLogic Support Site](#).
2. In SL1, go to the **PowerPacks** page (System > Manage > PowerPacks).
3. Click the **[Actions]** button and choose *Import PowerPack*. The **Import PowerPack** dialog box appears.
4. Click **[Browse]** and navigate to the PowerPack file from step 1.
5. Select the PowerPack file and click **[Import]**. The **PowerPack Installer** modal displays a list of the PowerPack contents.
6. Click **[Install]**. The PowerPack is added to the **PowerPacks** page.

NOTE: If you exit the **PowerPack Installer** modal without installing the imported PowerPack, the imported PowerPack will not appear in the **PowerPacks** page. However, the imported PowerPack will appear in the **Imported PowerPacks** modal. This page appears when you click the **[Actions]** menu and select *Install PowerPack*.

Configuration and Discovery for Standard Cisco CloudCenter Suite Deployments

The *Cisco CloudCenter Suite* PowerPack lets you discover and collect configuration and performance data about CloudCenter Suite deployments and their components. The following sections describe the configuration and discovery steps for monitoring standard CloudCenter Suite deployments.

Creating a Basic/Snippet Credential for Standard Deployments

To configure SL1 to monitor a CloudCenter Suite deployment, you must first create a Basic/Snippet credential. This credential allows the Dynamic Applications in the *Cisco CloudCenter Suite* PowerPack to communicate with your CloudCenter Suite.

The PowerPack includes an example Basic/Snippet credential (**Cisco CloudCenter EXAMPLE**) that you can edit for your own use.

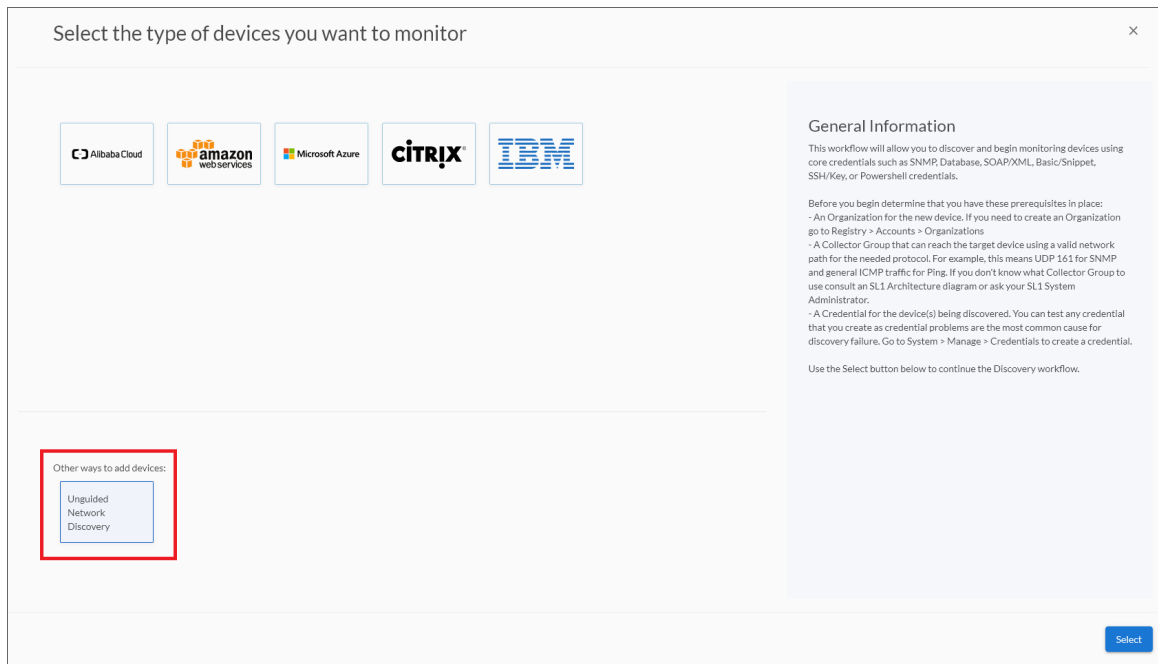

To configure a Basic/Snippet credential to access CloudCenter Suite:

1. Go to the **Credential Management** page (System > Manage > Credentials).
2. Locate the **Cisco CloudCenter EXAMPLE** credential, and then click its wrench icon (). The **Edit Basic/Snippet Credential** modal appears.
3. Enter values in the following fields.
 - **Credential Name**. Type a name for the CloudCenter Suite credential.
 - **Username**. Type the User ID for a CloudCenter Suite user that has root tenant administration privileges. This account must be an API user, not a UI user.
 - **Password**. Type the API key for the user you entered in the **Username** field.
4. Leave all other fields set to the default values. Click the **[Save As]** button.

Discovering the CloudCenter Suite Root Tenant

To discover CloudCenter Suite, perform the following steps:

1. On the **Devices** page (📱) or the **Discovery Sessions** page (Devices > Discovery Sessions), click the **[Add Devices]** button. The **Select** page appears:

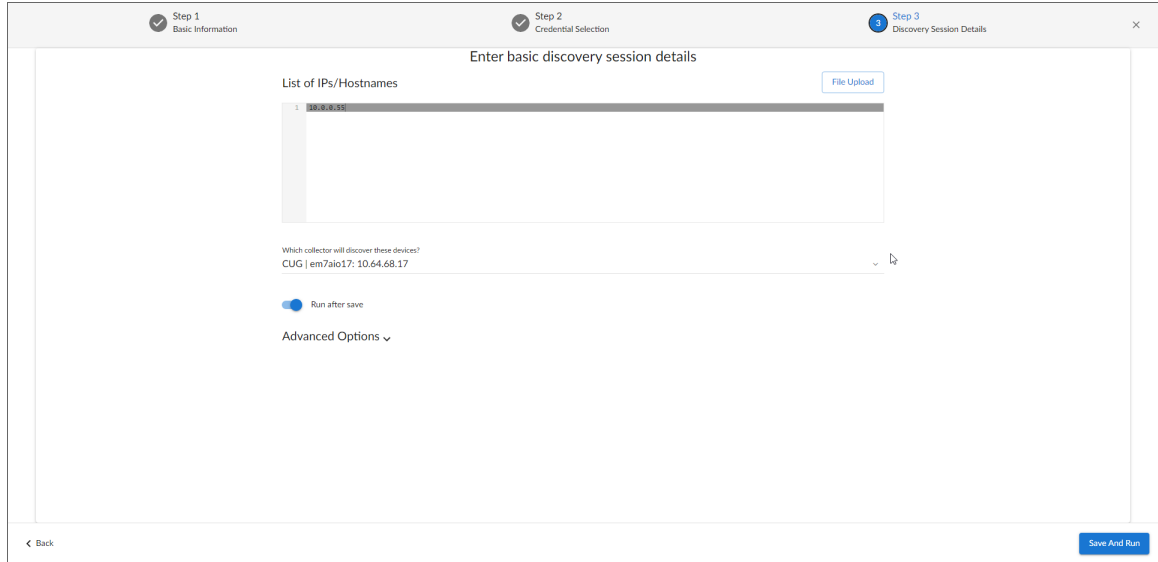

2. Click the **[Unguided Network Discovery]** button. Additional information about the requirements for discovery appears in the **General Information** pane to the right.
3. Click **[Select]**. The **Add Devices** page appears:
4. Complete the following fields:
 - **Name**. Type a unique name for this discovery session. This name is displayed in the list of discovery sessions on the **[Discovery Sessions]** tab.
 - **Description**. Optional. Type a short description of the discovery session. You can use the text in this description to search for the discovery session on the **[Discovery Sessions]** tab.
 - **Select the organization to add discovered devices to**. Select the name of the organization to which you want to add the discovered devices.

5. Click **[Next]**. The **Credentials** page of the **Add Devices** wizard appears:

6. On the **Credentials** page, locate and select the Basic/Snippet credential you created for the CloudCenter Suite root tenant.
7. Click **[Next]**. The **Discovery Session Details** page of the **Add Devices** wizard appears:

8. Complete the following fields:

- **List of IPs/Hostnames.** Enter the IP address for the CloudCenter Suite root tenant.
- **Which collector will monitor these devices?** Select an existing collector to monitor the discovered devices. Required.

- **Run after save.** Select this option to run this discovery session as soon as you click [**Save and Close**].

In the **Advanced options** section, click the down arrow icon () to complete the following fields:

- **Discover Non-SNMP.** Enable this setting.
9. Click [**Save and Close**] to save the discovery session. The **Discovery Sessions** page (Devices > Discovery Sessions) displays the new discovery session.
 10. If you selected the **Run after save** option on this page, the discovery session runs, and the **Discovery Logs** page displays any relevant log messages. If the discovery session locates and adds any devices, the **Discovery Logs** page includes a link to the **Device Investigator** page for the discovered device.

Discovering the CloudCenter Suite Root Tenant in the SL1 Classic User Interface

To discover CloudCenter Suite, perform the following steps:

1. Go to the **Discovery Control Panel** page (System > Manage > Classic Discovery).
2. In the **Discovery Control Panel**, click the [**Create**] button.
3. The **Discovery Session Editor** page appears. In the **Discovery Session Editor** page, define values in the following fields:
 - **IP Address/Hostname Discovery List.** Enter the IP address for the CloudCenter Suite root tenant.
 - **Other Credentials.** Select the Basic/Snippet credential you created for the CloudCenter Suite root tenant.
 - **Discover Non-SNMP.** Select this checkbox.
4. Optionally, you can enter values in the other fields on this page. For more information about the other fields on this page, see the **Discovery & Credentials** manual.
5. Click the [**Save**] button to save the discovery session and then close the **Discovery Session Editor** window.
6. The discovery session you created appears at the top of the **Discovery Control Panel** page. Click its lightning-bolt icon () to run the discovery session.
7. The **Discovery Session** window appears. When the device is discovered, click the device icon () to view the **Device Properties** page for the device.

Verifying Discovery and Dynamic Application Alignment

To verify that SL1 automatically aligned the correct Dynamic Applications during discovery:

1. From the **Device Properties** page for the CloudCenter Suite root device, click the [**Collections**] tab. The **Dynamic Application Collections** page appears.
2. All applicable Dynamic Applications for CloudCenter Suite are automatically aligned during discovery.

NOTE: It can take several minutes after the discovery session has completed for Dynamic Applications to appear in the **Dynamic Application Collections** page.

The following Dynamic Applications should be aligned to the device:

- Cisco: Cloud Center Suite Component Counts
- Cisco: Cloud Center Suite Action Orchestrator Discovery
- Cisco: Cloud Center Suite CCM Discovery
- Cisco: Cloud Center Suite Cost Optimizer Discovery
- Cisco: Cloud Center Suite Tenant Discovery
- Cisco: Cloud Center Suite Tenant Parent Relationships

If the listed Dynamic Applications have not been automatically aligned during discovery, you can align them manually. To do so, perform the following steps:

1. Click the **[Action]** button and then select *Add Dynamic Application*. The **Dynamic Application Alignment** page appears.
2. In the **Dynamic Applications** field, select the Dynamic Application you want to align.
3. In the **Credentials** field, select the Basic/Snippet credential you created for CloudCenter Suite.
4. Click the **[Save]** button.
5. Repeat steps 1-4 for the other unaligned Dynamic Applications.

Discovering Multiple Tenants for Standard Deployments

The *Cisco CloudCenter Suite PowerPack* can be used to monitor a CloudCenter Suite cluster that includes multiple tenants. To discover multiple tenants, you must follow the steps in the following sections for each tenant in order (in other words, parents must be discovered before their children):

- [Creating a Credential for a CloudCenter Suite Tenant](#)
- [Discovering an additional CloudCenter Suite Tenant](#)

For each tenant, you must use the administrator account for that tenant when you create the credential.

Creating a Credential for a CloudCenter Suite Tenant

To configure a Basic/Snippet credential to access an additional CloudCenter Suite tenant:

1. Go to the **Credential Management** page (System > Manage > Credentials).
2. Locate the credential you used to discover the root tenant, then click its wrench icon (). The **Edit Basic/Snippet Credential** modal appears.
3. Enter values in the following fields:
 - **Credential Name.** Enter a new name for the CloudCenter Suite tenant credential.

- **Username.** Enter the User ID for a CloudCenter Suite user that is an administrator for the tenant you want to discover.

CAUTION: The account specified must be an API user, not a GUI user.

- **Password.** Enter the API key for the user you entered in the **Username** field.

4. Leave all other fields set to the default values. Click the **[Save As]** button.

Discovering an Additional CloudCenter Suite Tenant

To discover an additional tenant:

1. From the **Device Properties** page for the CloudCenter Suite root device, click the name of the CloudCenter Cluster device that appears in the **Root Device** field.
2. Click the **[Collections]** tab. The **Dynamic Application Collections** page appears.
3. Select the checkbox for the "Cisco: CloudCenter Tenant Discovery" Dynamic Application.
4. In the **Select Action** drop-down list, select the credential you created for the tenant.
5. Click **[Go]**.

Viewing CloudCenter Suite Component Devices

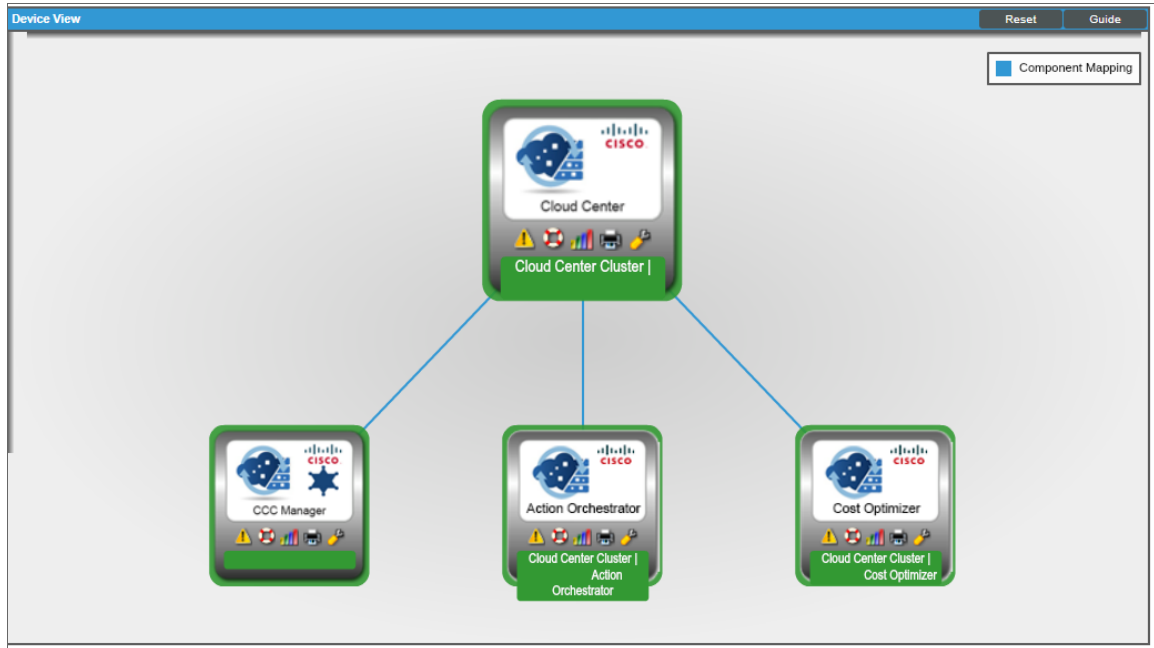

You can view CloudCenter Suite component devices in the following places in the user interface:

- The **Device Investigator** Map page (click **Map** in the **Device Investigator** page) displays a map of a particular device and all of the devices with which it has parent-child relationships. Double-clicking any of the listed devices reloads the page to make the selected device the primary device.
- The **Device Components** page (Devices > Device Components) displays a list of all root devices and component devices discovered by SL1. The **Device Components** page displays all root devices and component devices in an indented view, so you can easily view the hierarchy and relationships between child devices, parent devices, and root devices. To view the component devices associated with CloudCenter Suite, find the CloudCenter Suite root device and click its plus icon (+).
- The **Component Map** page (Classic Maps > Device Maps > Components) allows you to view devices by root node and view the relationships between root nodes, parent components, and child components in a map. This makes it easy to visualize and manage root nodes and their components. SL1 automatically updates the **Component Map** as new component devices are discovered. The platform also updates each map with the latest status and event information. To view the map for CloudCenter, go to the **Component Map** page and select the map from the list in the left NavBar. To learn more about the **Component Map** page, see the *Maps* manual.

Viewing CloudCenter Suite Component Devices in the SL1 Classic User Interface

In addition to the **Device Manager** page (Registry > Devices > Device Manager), you can view CloudCenter Suite component devices in the following places in the user interface:

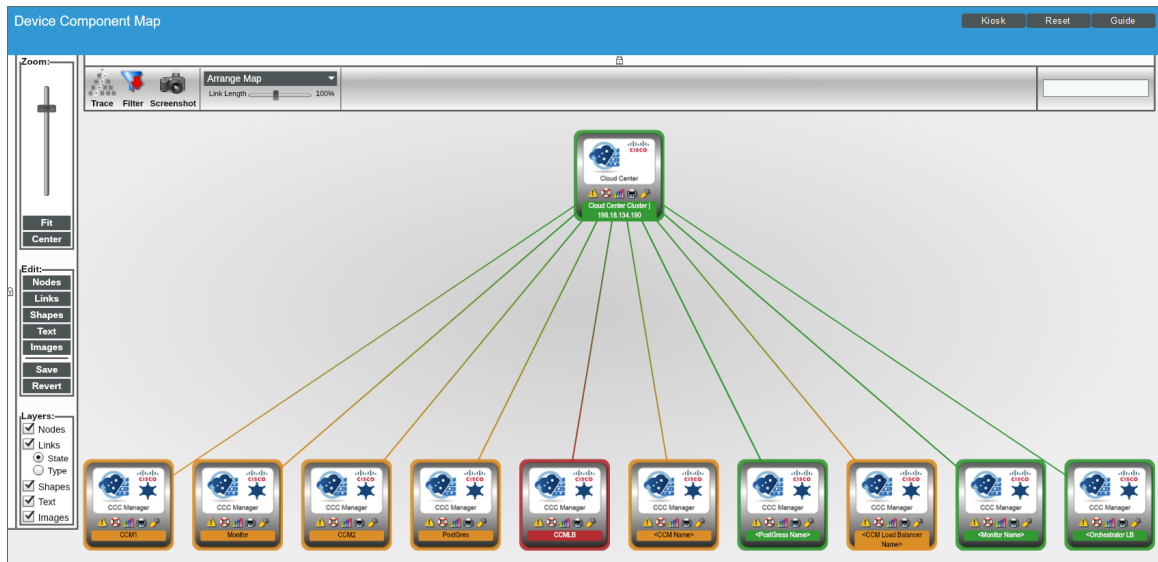

- The **Device View** page displays a map of a particular device and all of the devices with which it has parent-child relationships. Double-clicking any of the devices listed reloads the page to make the selected device the primary device:

- The **Device Components** page (Registry > Devices > Device Components) displays a list of all root devices and component devices discovered by SL1 in an indented view, so you can easily view the hierarchy and relationships between child devices, parent devices, and root devices. To view the component devices associated with CloudCenter Suite, find the CloudCenter Suite root device and click its plus icon (+):

Device Components Devices Found [3]								
Device Name	IP Address	Device Category	Device Class Sub-class	DID	Organization	Current State	Collection Group	Collection State
[Expandable Section 1]								
1. + Cloud Center Cluster	--	Software	Cisco Systems Cloud Center	10381	MOCK CCS	Healthy	CUG	Active
2. + Cloud Center Cluster	--	Software	Cisco Systems Cloud Center	31427	JALA CCS	Healthy	CUG	Active
[Expandable Section 2]								
1.	--	Software	Cisco Systems Cloud Center Manager	31428	JALA CCS	Healthy	CUG	Active
2.	Action	Software	Cisco Systems CCS Action Orchestrator	31439	JALA CCS	Healthy	CUG	Active
3.	Cost O	Software	Cisco Systems CCS Cost Optimizer	31430	JALA CCS	Healthy	CUG	Active
3. +	MOCK-TENANT 1	Infrastructure	Cisco Systems Cloud Center Tenant	31429	JALA CCS	Healthy	CUG	Active

- The **Component Map** page (Classic Maps > Device Maps > Components) allows you to view devices by root node and view the relationships between root nodes, parent components, and child components in a map. This makes it easy to visualize and manage root nodes and their components. SL1 automatically updates the **Component Map** as new component devices are discovered. The platform also updates each map with the latest status and event information. To view the map for CloudCenter Suite, go to the **Component Map** page and select the map from the list in the left NavBar. To learn more about the **Component Map** page, see the **Views** manual.

Manually Aligning Cisco CloudCenter Suite to a MongoDB on a Docker Swarm

If you want to monitor your MongoDB instance, you must have both the Docker and Cisco CloudCenter Suite PowerPacks installed. You must also have the Docker Swarm discovered and the component tree for it built out before doing the following steps to align the MongoDB Status Dynamic Application to your MongoDB instance.

To manually align the MongoDB Status Dynamic Application:

1. Go to the **Device Manager** page (Registry > Devices > Device Manager).
2. Locate the Docker Service where your MongoDB instance resides, and then click its wrench icon (). The **Device Properties** page appears.
3. Click the **[Collections]** tab. The **Dynamic Application Collections** page appears.
4. Click the **[Actions]** button and select *Add Dynamic Application* from the menu.
5. In the **Dynamic Application Alignment** modal:
 - In the **Dynamic Applications** field, select *MongoDB Status*.
 - In the **Credentials** field, select the credential that you used to discover the Docker Swarm.
6. Click **[Save]** to align the Dynamic Application with the Docker Service. The Dynamic Application begins collecting data at its default polling interval.

Manually Aligning RabbitMQ to the Remote Cloud

If you want to monitor your remote cloud using RabbitMQ, you must have both the Docker and AMQP: RabbitMQ PowerPacks installed. You must also have the Docker swarm (remote cloud) discovered and the component tree for it built out before doing the following steps to align RabbitMQ with your remote cloud.

1. Open the **Device Components** page (Registry > Devices > Device Components) and locate your remote cloud (Docker swarm).
2. Edit the swarm by clicking its wrench icon ().
3. Click on the **Collections** tab.
4. Add the following RabbitMQ Dynamic Applications to the collection.
 - AMQP: RabbitMQ Configuration
 - AMQP: RabbitMQ Performance
 - a. Click **[Actions]** and select *Add Dynamic Application*.
The **Dynamic Application Alignment** page appears.
 - b. In the **Dynamic Applications** field, select one of the RabbitMQ Dynamic Applications.

- c. In the **Credentials** field, select the Basic/Snippet credential you created for RabbitMQ.

NOTE: When adding these Dynamic Applications to the remote cloud, you must select the RabbitMQ API credential to use. The API credentials are the same as UI credentials for RabbitMQ. For more information, see "Creating a Credential for RabbitMQ" in the *Monitoring RabbitMQ* manual.

- d. Click **[Save]**.
- e. Repeat steps a - d for the other unaligned Dynamic Application for RabbitMQ.

Relationships Between Component Devices

SL1 can automatically build relationships between CloudCenter component devices and other associated devices:

- If you discover an ACI system using the Dynamic Applications in the *Cisco: ACI PowerPack* version 106 or later, SL1 will automatically create relationships between CloudCenter Applications and ACI Application Network Profiles.
- If you discover an AWS account using the Dynamic Applications in the *Amazon Web Services PowerPack* version 103 or later, SL1 will automatically create relationships between CloudCenter Applications and AWS EC2 Instances.
- If you discover an Azure account using the Dynamic Applications in the *Microsoft: Azure PowerPack* version 103 or later, SL1 will automatically create relationships between CloudCenter Applications and Azure Virtual Machines.
- If you discover a vCenter device using the Dynamic Applications in the *VMware: vSphere Base Pack PowerPack* version 207 or later, SL1 will automatically create relationships between CloudCenter Applications and VMware Virtual Machines.
