Introduction

Overview

This chapter describes how to monitor a Cisco Unified Communications Manager (CM) system in SL1.

The following sections provide an overview of Cisco Unified CM and the *Cisco: CUCM Unified Communications Manager PowerPack*:

<i>What is Cisco Unified Communications Manager?</i>	3
<i>What Does the Cisco: CUCM Unified Communications Manager PowerPack Monitor?</i>	4
<i>Supported Versions</i>	4
<i>Installing the Cisco: CUCM Unified Communications Manager PowerPack</i>	4

NOTE: ScienceLogic provides this documentation for the convenience of ScienceLogic customers. Some of the configuration information contained herein pertains to third-party vendor software that is subject to change without notice to ScienceLogic. ScienceLogic makes every attempt to maintain accurate technical information and cannot be held responsible for defects or changes in third-party vendor software. There is no written or implied guarantee that information contained herein will work for all third-party variants. See the End User License Agreement (EULA) for more information.

What is Cisco Unified Communications Manager?

Cisco Unified Communications Manager, also known as CallManager, is a unified call control and communications platform that provides services such as session management, voice, video, messaging, mobility, and web conferencing. Multiple CallManager servers can be grouped together into a cluster, which enables the CallManagers to share resources and features for better system scalability.

What Does the Cisco: CUCM Unified Communications Manager PowerPack Monitor?

To monitor Cisco Unified CM using SL1, you must install the *Cisco: CUCM Unified Communications Manager PowerPack*. This PowerPack enables you to discover, model, and collect data about your Cisco Unified CM system and clusters.

The *Cisco: CUCM Unified Communications Manager PowerPack* includes:

- An example credential you can use as a template to create a Basic/Snippet credential to connect to the Cisco Unified CM clusters you want to monitor
- Dynamic Applications to discover, model, and monitor performance metrics and collect configuration data for Cisco Unified CM clusters
- Device Classes for each of the Cisco Unified CM clusters that SL1 monitors
- Event Policies and corresponding alerts that are triggered when Cisco Unified CM clusters meet certain status criteria
- Dashboards that display graphical information about Cisco Unified CM clusters
- Run Book Actions and Run Book Automation policies that assign the Cisco Unified CM cluster root device to the appropriate Device Class, merge subscriber and physical component devices, and clear any unregistration events for a device when the same device is registered on another node in the cluster

NOTE: The Run Book Action that assigns the root device disables the Cisco Unified CM cluster root device's *Auto-Update* option.

Supported Versions

You can use this PowerPack to monitor versions 10.x, 11.x, 12.x and 14.x of Cisco Unified CM.

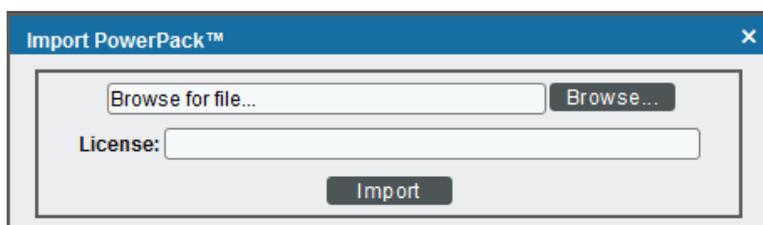

Installing the Cisco: CUCM Unified Communications Manager PowerPack

Before completing the steps in this manual, you must import and install the latest version of the *Cisco: CUCM Unified Communications Manager PowerPack*.

TIP: By default, installing a new version of a PowerPack overwrites all content from a previous version of that PowerPack that has already been installed on the target system. You can use the **Enable Selective PowerPack Field Protection** setting in the **Behavior Settings** page (System > Settings > Behavior) to prevent new PowerPacks from overwriting local changes for some commonly customized fields. (For more information, see the **System Administration** manual.)

To download and install a PowerPack:

1. Download the PowerPack from the [ScienceLogic Support Site](#).
2. Go to the **PowerPack Manager** page (System > Manage > PowerPacks).
3. In the **PowerPack Manager** page, click the **[Actions]** button, then select *Import PowerPack*.
4. The **Import PowerPack** dialog box appears:

5. Click the **[Browse]** button and navigate to the PowerPack file.
6. When the **PowerPack Installer** modal appears, click the **[Install]** button to install the PowerPack.

NOTE: If you exit the **PowerPack Installer** modal without installing the imported PowerPack, the imported PowerPack will not appear in the **PowerPack Manager** page. However, the imported PowerPack will appear in the **Imported PowerPacks** modal. This page appears when you click the **[Actions]** menu and select *Install PowerPack*.

Chapter

2

Configuration and Credentials

Overview

The following sections describe how to configure a Cisco Unified Communications Manager (CM) system for monitoring by SL1 using the *Cisco: CUCM Unified Communications Manager PowerPack*:

<i>Prerequisites for Monitoring CUCM</i>	6
<i>Configuring the ScienceLogic Platform to Monitor CUCM</i>	7
<i>Configuring CUCM for NAT</i>	10
<i>Enabling the CUCM AXL Web Service</i>	11
<i>Configuring a CUCM User Account</i>	12
<i>Configuring Prime License Manager</i>	19
<i>Creating a CUCM Credential</i>	21
<i>Creating a CUCM Credential in the SL1 Classic User Interface</i>	22
<i>Testing the CUCM Credential</i>	23
<i>Manually Creating Host File Entries for CUCM Nodes</i>	25

Prerequisites for Monitoring CUCM

During the discovery process, SL1 automatically aligns the IP addresses and hostnames for each node in a Cisco Unified CM cluster via DNS.

If you do not have access to DNS for the Cisco Unified CM systems that you want to monitor with SL1, ensure that you know or have access to the following information about each node:

- IP address
- Hostname

Configuring the ScienceLogic Platform to Monitor CUCM

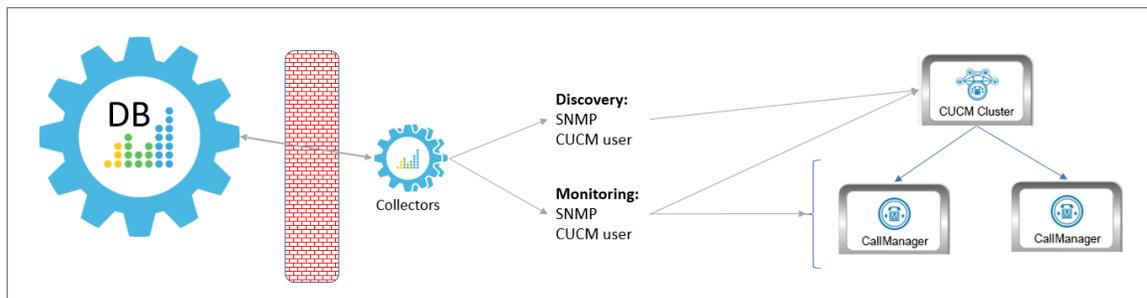

You can choose from several different possible configurations when using SL1 to monitor Cisco Unified CM:

- You can have the ScienceLogic Data Collector either in front of a firewall or behind a firewall.
- You can define the CallManager nodes either by hostname or by IP address in the Cisco Unified CM database.
- In some scenarios, you can also use network address translation (NAT) when defining the CallManagers.

These various methods are described in this section.

Method 1

In the first scenario, the Data Collector sits in front of the firewall and you define the CallManagers by hostname:

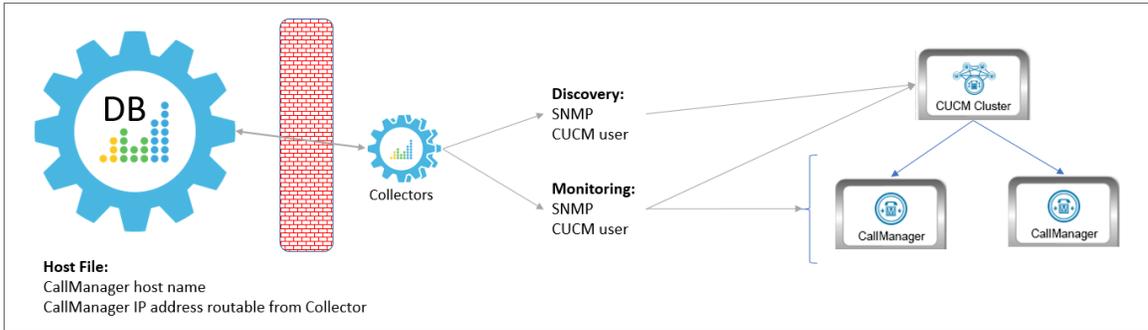

In this scenario, you must have the following ports open for the firewall:

Direction	Port	Protocol
ScienceLogic Database Server to the Data Collector	7707	TCP
PhoneHome Collector to the Database Server	7705	TCP

Method 2

In the second scenario, the Data Collector sits in front of the firewall and you define the CallManagers by IP address. This method requires you to *create a host file* that includes the CallManager hostname and IP address:

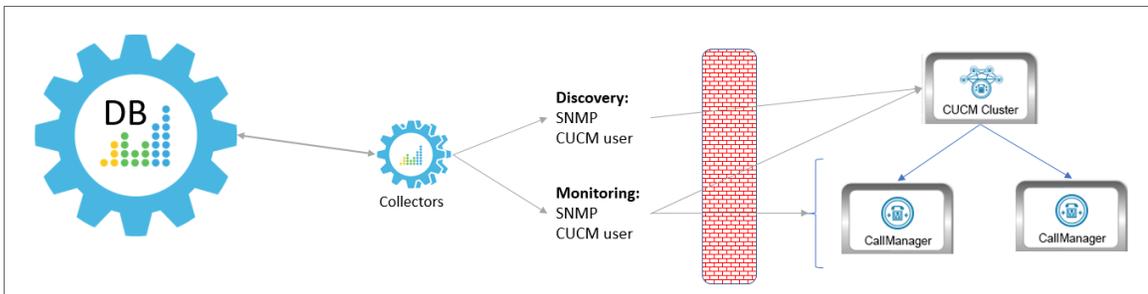

In this scenario, you must have the following ports open for the firewall:

Direction	Port	Protocol
ScienceLogic Database Server to the Data Collector	7707	TCP
PhoneHome Collector to the Database Server	7705	TCP

Method 3

In the third scenario, the Data Collector sits behind the firewall and you define the CallManagers by hostname:

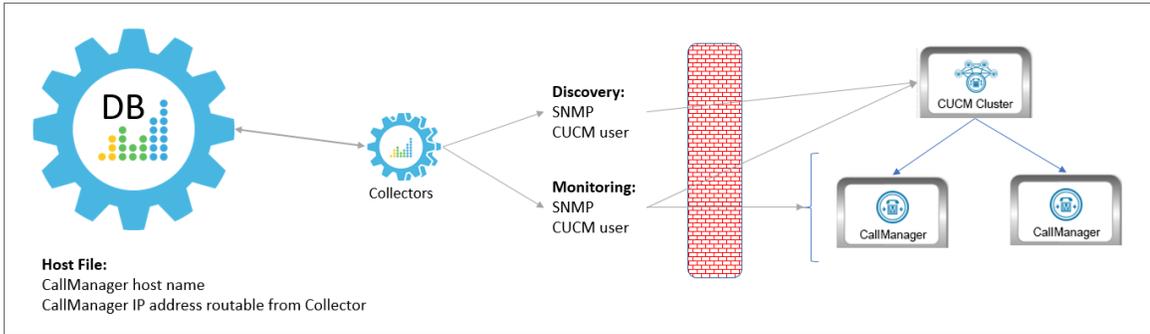

In this scenario, you must have the following ports open for the firewall:

Direction	Credential	Port	Protocol
ScienceLogic Data Collector to the Cisco Unified CM Cluster and CallManagers	SNMP	161	UDP
	Cisco Unified CM user	8443	TCP

Method 4

In the fourth scenario, the Data Collector sits behind the firewall and you define the CallManagers by hostname, with NAT. This method requires you to [create a host file](#) that includes the CallManager hostname and the IP address the Data Collector can use to access the device:

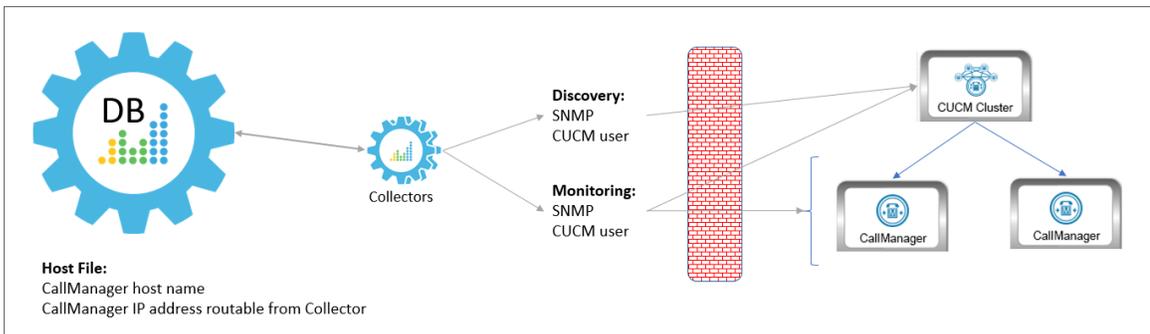

In this scenario, you must have the following ports open for the firewall:

Direction	Credential	Port	Protocol
ScienceLogic Data Collector to the Cisco Unified CM Cluster and CallManagers	SNMP	161	UDP
	Cisco Unified CM user	8443	TCP

Method 5

In the final scenario, the Data Collector sits behind the firewall and you define the CallManagers by IP address, with NAT. This method requires you to [create a host file](#) that includes the CallManager host name and IP address the Data Collector can use to access the device:

NOTE: This method is not supported by versions of the *Cisco: CUCM Unified Communications Manager PowerPack* prior to version 109.

In this scenario, you must have the following ports open for the firewall:

Direction	Credential	Port	Protocol
ScienceLogic Data Collector to the Cisco Unified CM Cluster and CallManagers	SNMP	161	UDP
	Cisco Unified CM user	8443	TCP

Configuring CUCM for NAT

If you are using Network Address Translation (NAT) in your environment, you will need to adjust a threshold in the "Cisco: CUCM Cluster Information" Dynamic Application to enable NAT support.

To configure the threshold object:

1. Go to the **Dynamic Applications Manager** page (System > Manage > Dynamic Applications).
2. Locate the "Cisco: CUCM Cluster Information" Dynamic Application and click its wrench icon (.
3. In the **Dynamic Applications Properties Editor**, click the **[Thresholds]** tab.
4. Click the wrench icon () for the "Use Server Hostname for NAT" threshold object.
5. Ensure that the **Override Threshold Value** field is set to *Enabled*.
6. In the **Threshold Value** field, type "1".

NOTE: The **Threshold Value** will be reset when you upgrade the PowerPack if you have not enabled the **Enable Selective PowerPack Field Protection** setting. To do this, go to the **Behavior Settings** page (System > Settings > Behavior) and click the **Enable Selective PowerPack Field Protection** checkbox.

7. Click **[Save]**.

Enabling the CUCM AXL Web Service

SL1 can monitor a Cisco Unified CM system by requesting detailed information about the system from the Cisco Unified CM AXL Web Service.

The Cisco Unified CM AXL web service is disabled by default. To enable the AXL web service, perform the following steps:

1. In a browser window, navigate to the following address:
`https://ip-address-of-CM-system:8443/ccmadmin/showHome.do`
2. Log in to the Cisco Unified CM Administration site as an administrator.
3. In the **Navigation** drop-down list at the top-right corner of the page, select *Cisco Unified Serviceability*, and then click the **[Go]** button. The **Cisco Unified Serviceability** page appears:

- In the navigation bar at the top-left of the page, hover over **Tools**, then select **Service Activation**. The **Service Activation** page appears:

The screenshot shows the Cisco Unified Serviceability interface for Service Activation. At the top, there's a navigation bar with 'Alarm', 'Trace', 'Tools', 'Setup', and 'Help'. Below that, the 'Service Activation' section includes buttons for 'Save', 'Set to Default', and 'Refresh'. The 'Status' section shows 'Status : Ready'. The 'Select Server' section has a dropdown menu with '192.168.44.22' selected and a 'Go' button. There's also a checkbox for 'Check All Services'. Below this are two tables: 'CM Services' and 'CTI Services'. Each table has columns for 'Service Name' and 'Activation Status'. In the 'CM Services' table, 9 services are checked and 'Activated', while 'Cisco DHCP Monitor Service' is unchecked and 'Deactivated'. In the 'CTI Services' table, both 'Cisco IP Manager Assistant' and 'Cisco WebDialer Web Service' are checked and 'Activated'.

CM Services		
	Service Name	Activation Status
<input checked="" type="checkbox"/>	Cisco CallManager	Activated
<input checked="" type="checkbox"/>	Cisco Tftp	Activated
<input checked="" type="checkbox"/>	Cisco Messaging Interface	Activated
<input checked="" type="checkbox"/>	Cisco Unified Mobile Voice Access Service	Activated
<input checked="" type="checkbox"/>	Cisco IP Voice Media Streaming App	Activated
<input checked="" type="checkbox"/>	Cisco CTIManager	Activated
<input checked="" type="checkbox"/>	Cisco Extension Mobility	Activated
<input checked="" type="checkbox"/>	Cisco Extended Functions	Activated
<input checked="" type="checkbox"/>	Cisco Dialed Number Analyzer	Activated
<input type="checkbox"/>	Cisco DHCP Monitor Service	Deactivated
<input checked="" type="checkbox"/>	Cisco Dialed Number Analyzer Server	Activated

CTI Services		
	Service Name	Activation Status
<input checked="" type="checkbox"/>	Cisco IP Manager Assistant	Activated
<input checked="" type="checkbox"/>	Cisco WebDialer Web Service	Activated

- In the **Server** drop-down list, select the Cisco Unified CM server for which you want to enable the AXL web service, and then click the **[Go]** button.
- In the list of services, locate the **Database and Admin Services** section. If the *Activation Status* of the **Cisco AXL Web Service** is "Activated", the AXL web service is already enabled.
- If the *Activation Status* of the **Cisco AXL Web Service** is not "Activated", select the checkbox for the **Cisco AXL Web Service**.
- Click the **[Save]** button at the bottom of the page to save your changes, and then click the **[OK]** button in the pop-up window that appears.

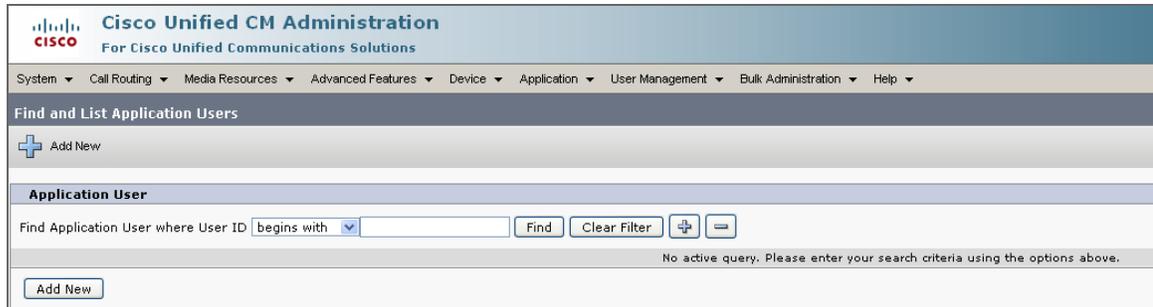

Configuring a CUCM User Account

ScienceLogic recommends that you create a Cisco Unified CM user account that will be used only by SL1 to access the AXL web service. To create a user account in Cisco Unified CM that can access only the AXL web service, perform these two steps:

- Create a user account.
- Create a user group that includes the user account and has permission to access only the AXL web service.

To create a new Cisco Unified CM user group and user account, perform the following steps:

1. In a browser window, navigate to the following address:
`https://ip-address-of-CM-system:8443/ccmadmin/showHome.do`
2. Log in to the Cisco Unified CM Administration site as an administrator.
3. In the navigation bar at the top-left of the page, hover over **User Management**, then select **Application User**. The **Find and List Users** page appears:

4. Click the [+ Add New] button. The **Application User Configuration** page appears:

The screenshot shows the Cisco Unified CM Administration interface for configuring an application user. The page title is "Application User Configuration". At the top, there is a navigation menu with options: System, Call Routing, Media Resources, Advanced Features, Device, Application, User Management, Bulk Administration, and Help. Below the navigation menu is a "Save" button. The main content area is divided into three sections: "Status", "Application User Information", and "Device Information".

Status
Status: Ready

Application User Information

User ID*

[Find more Route Points](#)

5. Supply values in the following fields:
 - **User ID.** Type a username for the new user.
 - **Password.** Type a password for the new user.
 - **Confirm Password.** Type the password for the new user again.
6. Click the **[Save]** button.

- In the navigation bar at the top-left of the page, hover over **User Management**, then select **User Group**. The **Find and List User Groups** page appears:

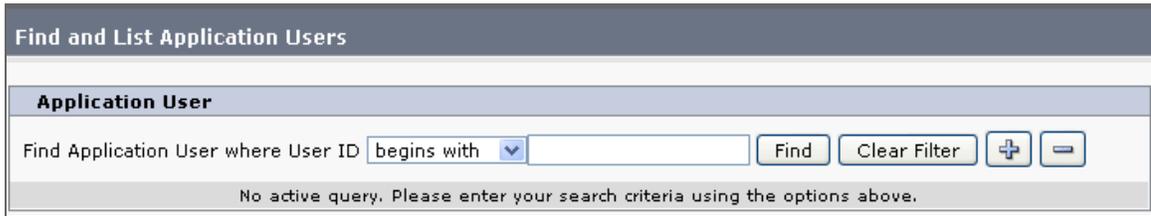

- Click the [+ Add New] button. The **User Group Configuration** page appears:

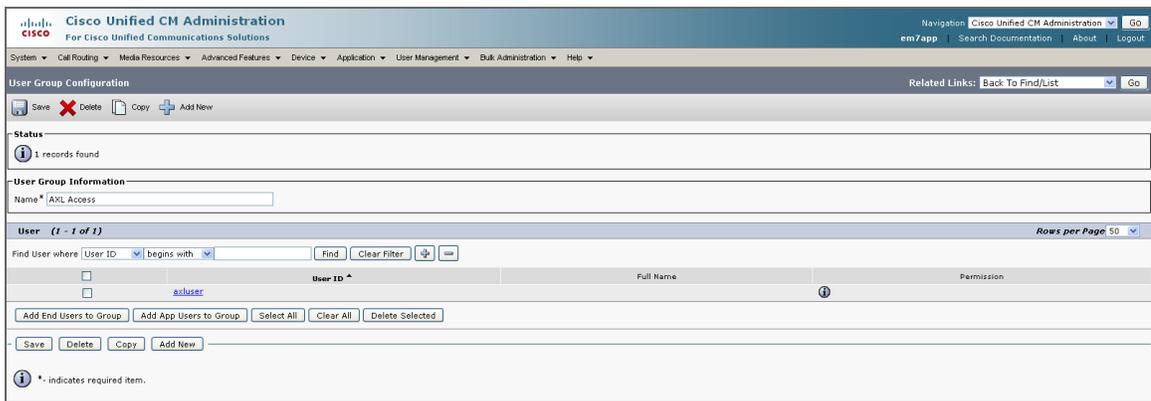

- In the **Name** field, type a name for the user group. For example, you could call the user group "AXL Access".
- Click the **[Save]** button.

- Click the **[Add App Users to Group]** button. The **Find and List Application Users** window appears:

- Click the **[Find]** button. In the list of users, select the checkbox for the user account that you created, then click the **[Add Selected]** button at the bottom of the page.
- The **Find and List Application Users** window closes. In the **User Group Configuration** page, the user account is included in the list of users:

14. In the **Related Links** drop-down list at the top-right hand corner of the page, select *Assign Role to User Group*, and then click the **[Go]** button. The **User Group Configuration** page appears:

The screenshot shows the Cisco Unified CM Administration interface for User Group Configuration. The page title is "Cisco Unified CM Administration For Cisco Unified Communications Solutions". The navigation menu includes System, Call Routing, Media Resources, Advanced Features, Device, Application, User Management, Bulk Administration, and Help. The main content area is titled "User Group Configuration" and contains a "Save" button, a "Status" section showing "Status: Ready", a "User Group Information" section with "Name* AXL Access", and a "Role Assignment" section with a "Role" dropdown menu, "Assign Role to Group", and "Delete Role Assignment" buttons. A "Save" button is also present at the bottom of the form. Below the form, there are three informational messages: "*- indicates required item.", "**The role Standard CCM Admin Users must be assigned to a user group to enable its members to logon to CCMAdmin web site", and "***The role Standard CCM End Users must be assigned to a user group to enable its members to logon to CCMUser web site".

15. Click the **[Assign Role to Group]** button. The **Find and List Roles** window appears:

The screenshot shows the "Find and List Roles" window. It has a title bar "Find and List Roles" and a "Role" section. The "Find Role where" section includes a dropdown menu for "Name", a dropdown menu for "begins with", a text input field, a "Find" button, a "Clear Filter" button, a "+" button, and a "-" button. Below the input field is a dropdown menu with the text "Select item or enter search text". At the bottom of the window, there is a message: "No active query. Please enter your search criteria using the options above."

16. Click the **[Find]** button. A list of roles appears:

Find and List Roles

Select All Clear All Add Selected Close

Status
 39 records found

Role (1 - 39 of 39) Rows per Page 50

Find Role where Name begins with Find Clear Filter + -
 Select item or enter search text

<input type="checkbox"/>	Name ^	Application	Description	Copy
<input type="checkbox"/>	Standard AXL API Access	Cisco Call Manager AXL Database	Access the AXL APIs	
<input type="checkbox"/>	Standard Admin Rep Tool Admin		Administer CAR	
<input type="checkbox"/>	Standard Audit Log Administration	Cisco Call Manager Serviceability	Serviceability Audit Log Administration	
<input type="checkbox"/>	Standard CCM Admin Users		All users with access to CCM web site	
<input type="checkbox"/>	Standard CCM End Users		Access to CCM User Option Pages	
<input type="checkbox"/>	Standard CCM Feature Management	Cisco Call Manager Administration	Standard CCM Feature Management	
<input type="checkbox"/>	Standard CCM Gateway Management	Cisco Call Manager Administration	Standard CCM Gateway Management	
<input type="checkbox"/>	Standard CCM Phone Management	Cisco Call Manager Administration	Standard CCM Phone Management	
<input type="checkbox"/>	Standard CCM Route Plan Management	Cisco Call Manager Administration	Standard CCM Route Plan Management	
<input type="checkbox"/>	Standard CCM Service Management	Cisco Call Manager Administration	Standard CCM Service Management	
<input type="checkbox"/>	Standard CCM System Management	Cisco Call Manager Administration	Standard CCM System Management	
<input type="checkbox"/>	Standard CCM User Management	Cisco Call Manager Administration	Standard CCM User Management	

17. Select the checkboxes for the following roles:

- *Standard AXL API Access*
- *Standard CCM Admin Users*
- *Standard SERVICEABILITY Read Only*

18. Click the **[Add Selected]** button at the bottom of the page.

19. The **Find and List Roles** window closes. In the **User Group Configuration** page, the **Roles** field includes the *Standard AXL API Access* role:

The screenshot shows the Cisco Unified CM Administration interface for User Group Configuration. The page title is "User Group Configuration". There is a "Save" button at the top left. The "Status" section shows "Status: Ready". The "User Group Information" section shows "Name * AXL Access". The "Role Assignment" section has a dropdown menu with three roles: "Standard AXL API Access", "Standard CCM Admin Users", and "Standard SERVICEABILITY Read Only". To the right of the dropdown are two buttons: "Assign Role to Group" and "Delete Role Assignment". At the bottom left of the form is another "Save" button. Below the form are three information icons with text: "*- indicates required item.", "**The role Standard CCM Admin Users must be assigned to a user group to enable its members to logon to CCMAdmin web site", and "***The role Standard CCM End Users must be assigned to a user group to enable its members to logon to CCMUser web site".

20. Click the **[Save]** button.

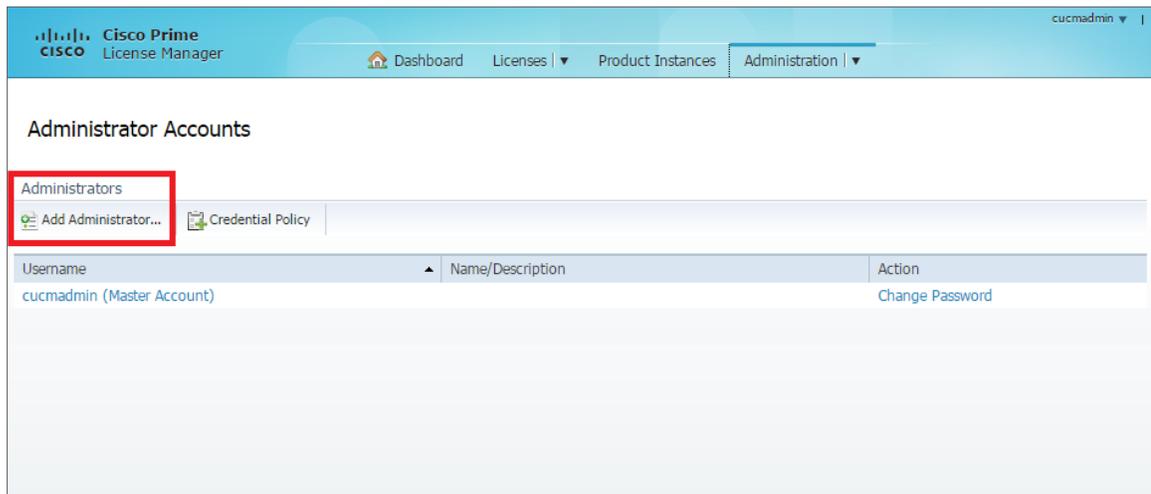

Configuring Prime License Manager

If you want to monitor Cisco Unified CM license information from Cisco Prime License Manager (PLM), you must create an administrator user account that SL1 can use to access PLM.

To create an administrator user in PLM:

1. In a browser window, navigate to the following address:
`https://ip-address-of-plm-server/elm-admin/`
2. Log in to the Cisco PLM site as an administrator.
3. In the **Administration** drop-down menu, select *Administrator Accounts*.

4. Click the **[Add Administrator]** button.

5. In the **Add Administrator Account** modal page, make entries in the following fields:

The screenshot shows a modal dialog box titled 'Add Administrator Account'. It contains a warning message: '- The minimum password length is 1.' Below this are four input fields: 'Name/Description:', '*Username:', '*Password:', and '*Re-enter Password:'. At the bottom right of the dialog are 'OK' and 'Cancel' buttons.

- **Name/Description.** Type a name or description for the account.
- **Username.** Type the account username.
- **Password.** Type the account password.
- **Re-enter Password.** Type the account password again.

6. Click **[OK]**.

Creating a CUCM Credential

To use the Dynamic Applications in the *Cisco: CUCM Unified Communications Manager PowerPack*, you must first define a Basic/Snippet Cisco Unified CM credential in SL1. This credential allows SL1 to communicate with the Cisco Unified CM cluster. The *Cisco: CUCM Unified Communications Manager PowerPack* includes a template you can use to create this Basic/Snippet credential.

NOTE: If you are using an SL1 system prior to version 11.1.0, the new user interface does not include the **Duplicate** option for sample credential(s). ScienceLogic recommends that you use *the classic user interface and the Save As button* to create new credentials from sample credentials. This will prevent you from overwriting the sample credential(s).

To modify the Cisco Unified CM Basic/Snippet Credential template for use with your Cisco Unified CM cluster:

1. Go to the **Credentials** page (Manage > Credentials).
2. Locate the "Cisco CUCM Example" sample credential. Click its **[Actions]** icon (⋮) and select **Duplicate**. A copy of the credential, called **Cisco CUCM Example copy** appears.
3. Click the **[Actions]** icon (⋮) for the **Cisco CUCM Example copy** credential and select **Edit**. The **Edit Credential** page appears:

The screenshot shows the 'Edit Credential' interface. It includes a 'Name' field with the value 'Cisco CUCM Example', an 'All Organizations' toggle (currently on), and a 'Timeout (ms)' field set to '30000'. Below these are fields for 'Hostname/IP' (value: %D), 'Port' (value: 8443), 'Username' (value: axluser), and 'Password' (masked). To the right, there is a 'Credential Tester' section with 'Select Credential Test' and 'Select Collector' dropdowns, the latter showing 'CUG | RING-ISO-B-CU: 10.2.10.16'. An 'IP or Hostname to test' field and a 'Test Credential' button are also present. A 'Close' button is located at the bottom right of the dialog.

4. Supply values in the following fields:
 - **Name**. Type a new name for the credential.
 - **All Organizations**. Toggle on (blue) to align the credential to all organizations, or toggle off (gray) and then select one or more specific organizations from the **What organization manages this service?** drop-down field to align the credential with those specific organizations.
 - **Timeout (ms)**. Type the timeout value of each request, in milliseconds. The default value is "30000".

- **Hostname/IP.** Type the hostname or IP address, or you can type the variable "%D".
- **Port.** Type the port number.

NOTE: The example credential included in older versions of the *Cisco: CUCM Unified Communications Manager PowerPack* used "80" as the default **Port** number. If your Cisco Unified CM credential specifies port 80, SL1 will automatically override that value and use port 8443 instead. If your Cisco Unified CM credential specifies any port other than 80, SL1 will use that specified port.

- **Username.** Type the username for the Cisco Unified CM user account that you created to access the AXL web service. For details, see the [Configuring a Cisco Unified CM User Account](#) section.
- **Password.** Type the password for the username you entered in the **Username** field.

4. Click **[Save & Close]**.

NOTE: If you would like to test your credential using the Credential Tester panel, click **[Save & Test]**. For detailed instructions on using the Credential Tester, see the [Testing the CUCM Credential](#) section.

Creating a CUCM Credential in the SL1 Classic User Interface

To use the Dynamic Applications in the *Cisco: CUCM Unified Communications Manager PowerPack*, you must first define a Basic/Snippet Cisco Unified CM credential in SL1. This credential allows SL1 to communicate with the Cisco Unified CM cluster. The *Cisco: CUCM Unified Communications Manager PowerPack* includes a template you can use to create this Basic/Snippet credential.

To modify the Cisco Unified CM Basic/Snippet Credential template for use with your Cisco Unified CM cluster:

1. Go to the **Credential Management** page (System > Manage > Credentials).
2. Click the wrench icon (🔧) for the *Cisco CUCM Example* credential. The **Credential Editor** modal window appears:

The screenshot shows the 'Credential Editor [84]' window. The title bar includes a close button (X). The main window has a blue header with the text 'Edit Basic/Snippet Credential #84' and two buttons: 'New' and 'Reset'. Below the header is a section titled 'Basic Settings' containing several input fields:

- Credential Name:** Cisco CUCM Example
- Hostname/IP:** %D
- Port:** 8443
- Timeout(ms):** 30000
- Username:** axluser
- Password:** ***

At the bottom of the form are two buttons: 'Save' and 'Save As'.

3. Supply values in the following fields:

- **Credential Name.** Type a new name for the credential.
- **Hostname/IP.** Type the hostname or IP address, or you can type the variable "%D".
- **Port.** Type the port number.

NOTE: The example credential included in older versions of the *Cisco: CUCM Unified Communications Manager PowerPack* used "80" as the default **Port** number. If your Cisco Unified CM credential specifies port 80, SL1 will automatically override that value and use port 8443 instead. If your Cisco Unified CM credential specifies any port other than 80, SL1 will use that specified port.

- **Timeout (ms).** Type the timeout value of each request, in milliseconds. The default value is "30000".
- **Username.** Type the username for the Cisco Unified CM user account that you created to access the AXL web service. For details, see the [Configuring a Cisco Unified CM User Account](#) section.
- **Password.** Type the password for the username you entered in the **Username** field.

4. Click the **[Save As]** button.

NOTE: If you are monitoring Cisco Unified CM license information with the Cisco Prime License Manager (PLM) and your PLM administrator username and password are the same as the user account you created to access the AXL web service, then you can use the same credential to access PLM. However, if your PLM administrator user information is different, then repeat these steps to create a credential to access PLM.

NOTE: If SNMP is enabled on the Cisco Unified CM cluster, then you can also create an optional SNMP credential that will be used only during discovery to classify the cluster device class. If SNMP is not available on the Cisco Unified CM cluster, then you **do not** need an SNMP credential. For more information on SNMP credentials, see the *Discovery and Credentials* manual.

Testing the CUCM Credential

SL1 includes a Credential Test for Cisco Unified CM. Credential Tests define a series of steps that SL1 can execute on demand to validate whether a credential works as expected.

The CUCM Credential Test can be used to test a Basic/Snippet credential for monitoring Cisco Unified CM using the Dynamic Applications in the *Cisco: CUCM Unified Communications Manager PowerPack*. The CUCM Credential Test performs the following steps:

- **Test Reachability.** Performs an ICMP ping request to see if the device is reachable.
- **Test Name Resolution.** Checks to see if nslookup can resolve the IP address or hostname.

- **Test Port Availability.** Performs an NMAP request to see if the appropriate port is open.
- **Test Accessibility to Publisher.** Checks to see if the common API service URLs on the publisher device can be queried.
- **Test Accessibility to Subscribers via Publisher.** Checks to see if data on a CUCM subscriber can be queried via the publisher.
- **Test Accessibility to All Subscribers.** Checks to see if the status of services on a CUCM subscriber can be queried.

To test the CUCM credential:

1. Go to the **Credential Test Management** page (System > Customize > Credential Tests).
2. Locate the **CUCM Credential Test** and click its lightning bolt icon (⚡). The **Credential Tester** modal page appears:

3. Supply values in the following fields:
 - **Test Type.** This field is pre-populated with the credential test you selected.
 - **Credential.** Select the credential to test. This drop-down list includes only credentials that you have access to that can be tested using the selected credential test.
 - **Hostname/IP.** Enter the IP address or hostname for the device.

NOTE: The credential being tested cannot include more than 32 characters in the **Hostname/IP** field.

- **Collector.** Select the All-In-One Appliance or Data Collector that will run the test.

4. Click the **[Run Test]** button to run the credential test. The **Test Credential** window appears:

Step	Description	Log Message	Status	
1	Test Reachability	Check to see if the device is reachable using ICMP	The device is reachable using ICMP. The average response time is 2.662ms	Passed
2	Test Name Resolution	Check to see if nlookup can resolve the IP and hostname	Name resolution succeeded: Reverse returned 1 result, Forward returned 1 result	Passed
3	Test Port Availability	Check to see if the appropriate port is open	Port 8443 is open	Passed
4	Test Accessibility to Publisher	Check to see if common API service URLs on the publisher device can be queried	CUCM API resource requests succeeded	Passed
5	Test Accessibility to Subscribers via Publisher	Check to see if data on a CUCM subscriber can be queried via the publisher	CUCM subscriber query through the publisher succeeded	Passed
6	Test Accessibility to All Subscribers	Check to see if the status of services on a CUCM subscriber can be queried	CUCM subscriber is accessible with this credential	Passed

The **Test Credential** window displays a log entry for each step in the credential test. The steps performed are different for each credential test. The log entry for each step includes the following information:

- **Step.** The name of the step.
- **Description.** A description of the action performed during the step.
- **Log Message.** The result of the step for this credential test.
- **Status.** Whether the result of this step indicates the credential or the network environment is configured correctly (Passed) or incorrectly (Failed).
- **Step Tip.** Mouse over the question mark icon () to display the tip text. The tip text recommends what to do to change the credential or the network environment if the step has a status of "Failed".

Manually Creating Host File Entries for CUCM Nodes

During the discovery process, SL1 automatically aligns the IP addresses and hostnames for each CallManager server (node) in a Cisco Unified CM cluster via DNS.

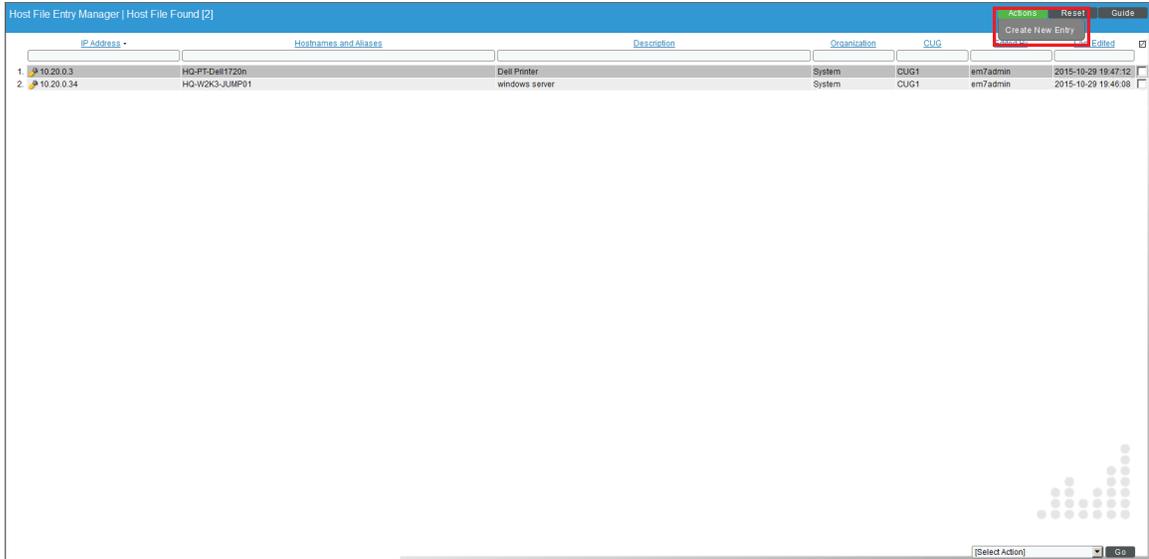

If you do not have access to DNS for the Cisco Unified CM system you want to monitor, you must manually create host file entries in SL1 for each node in the Cisco Unified CM cluster. Each host file entry must contain the IP address and hostname of a node in the Cisco Unified CM cluster.

NOTE: If you have access to DNS for the Cisco Unified CM system you want to monitor with SL1, you do not need to perform the steps to manually configure host file entries. Continue to the section on [Discovering a Cisco Unified CM Cluster](#).

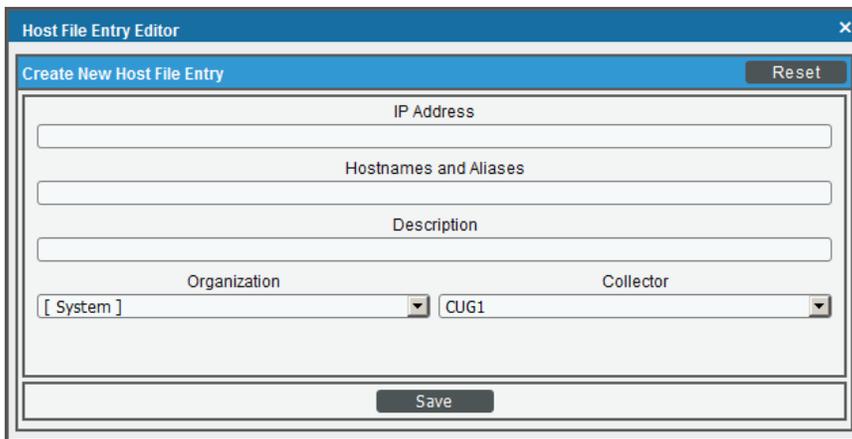

Repeat the following steps for each node in the Cisco Unified CM cluster.

To create a host file entry:

1. Go to the **Host File Entry Manager** page (System > Customize > Host Files).

2. Click the **[Action]** menu and choose **Create New Entry**. The **Create New Host File Entry** modal page appears.

3. In the **Create New Host File Entry** modal page, supply values in the following fields:

- **IP Address**. The IP address to resolve with the hostname.

NOTE: Server hostnames should be aligned to external IP addresses when supporting Network Address Translation (NAT) environments.

- **Hostnames and Aliases.** The hostname to align with the specified IP address. You can also include a space-delimited list of aliases for the host name.
- **Description.** Description of the host entry. This field is not written to the host file. This field is for administrators to use when managing host file entries.
- **Organization.** Organization associated with the host. You can select from a list of all existing organizations. This field is not written to the host file. This field is for administrators to use when managing host file entries. For example, a service provider could assign each customer its own organization and then use this field to manage host file entries for each customer.

4. Click the **[Save]** button to save the new host entry.

Discovery

Overview

The following sections describe how to discover Cisco Unified Communications Manager (CUCM) clusters in SL1 using the *Cisco: CUCM Unified Communications Manager PowerPack*:

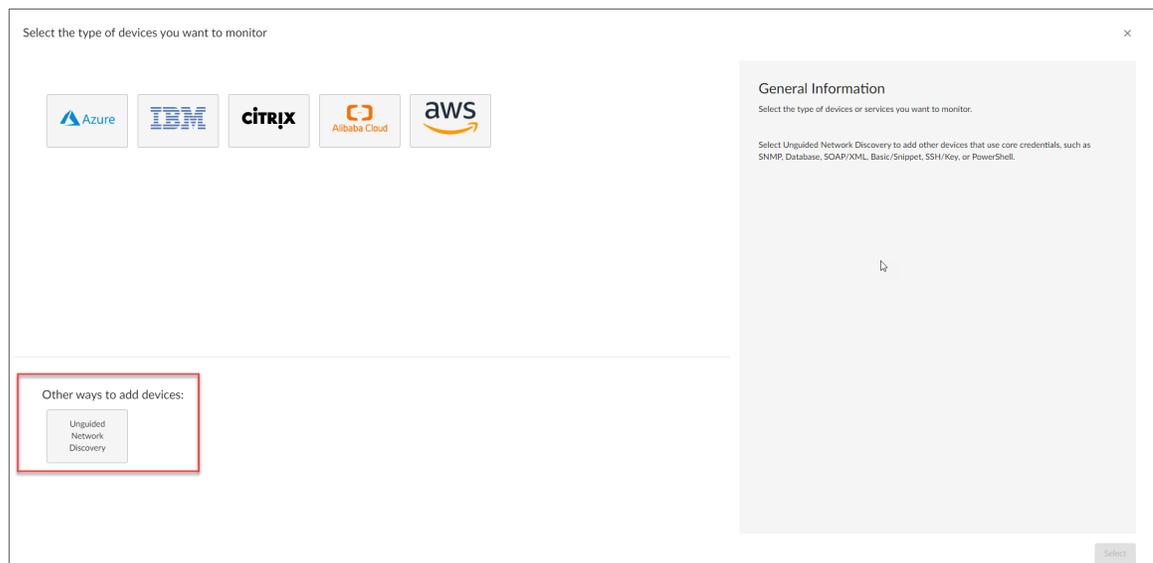

<i>Discovering a CUCM Cluster</i>	29
<i>Discovering a CUCM Cluster in the SL1 Classic User Interface</i>	31
<i>Verifying Discovery and Dynamic Application Alignment</i>	33
<i>Manually Aligning Dynamic Applications</i>	35
<i>Viewing Component Devices</i>	37

Discovering a CUCM Cluster

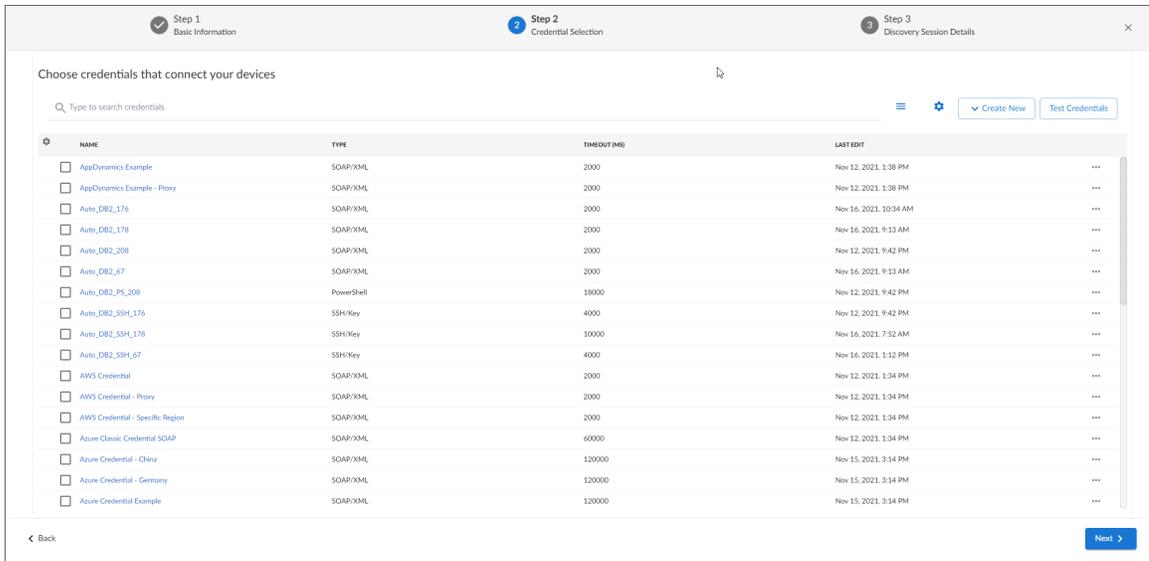

When you use the *Cisco: CUCM Unified Communications Manager PowerPack* to discover Cisco Unified CM devices, SL1 creates a device representing your Cisco Unified CM cluster. This cluster device acts as the root device for the remaining servers and component devices in your Cisco Unified CM system.

To create and run a discovery session that will discover a Cisco Unified CM cluster:

1. On the **Devices** page (🖨️) or the **Discovery Sessions** page (Devices > Discovery Sessions), click the **[Add Devices]** button. The **Select** page appears:

2. Click the **[Unguided Network Discovery]** button. Additional information about the requirements for discovery appears in the **General Information** pane to the right.
3. Click **[Select]**. The **Add Devices** page appears.
4. Complete the following fields:
 - **Name**. Type a unique name for this discovery session. This name is displayed in the list of discovery sessions on the **[Discovery Sessions]** tab.
 - **Description**. Optional. Type a short description of the discovery session. You can use the text in this description to search for the discovery session on the **[Discovery Sessions]** tab.
 - **Select the organization to add discovered devices to**. Select the name of the organization to which you want to add the discovered devices
5. Click **[Next]**. The **Credentials** page of the **Add Devices** wizard appears:

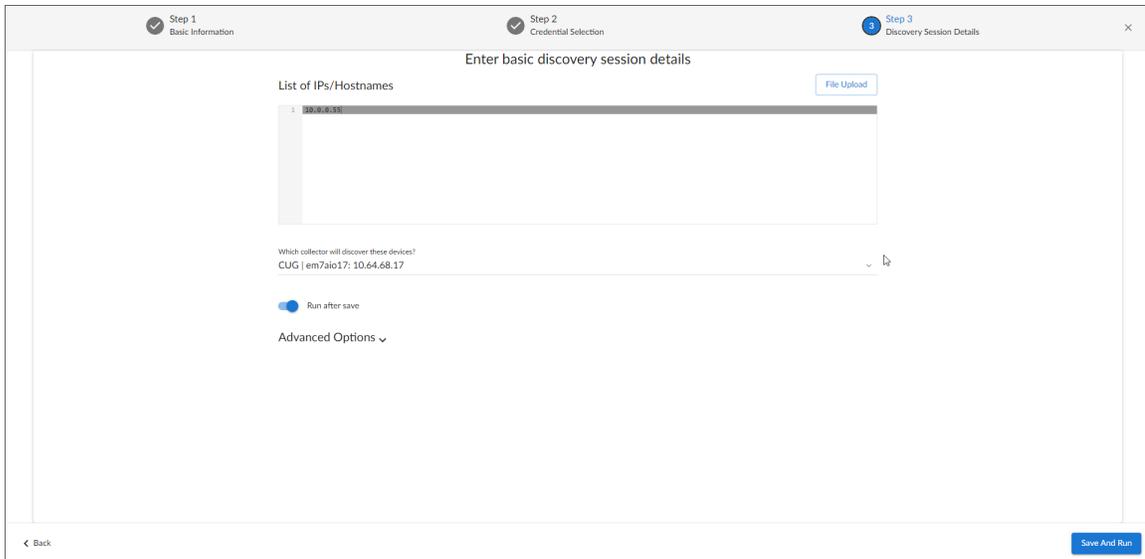

6. On the **Credentials** page:

- Select an SNMP credential to use with the Cisco Unified CM cluster. (For more information on SNMP credentials, see the **Discovery and Credentials** manual.).

NOTE: An SNMP credential is needed only to properly classify the devices in the cluster. If SNMP is not available on the Cisco Unified CM cluster, then you do not need to select an SNMP credential; in that scenario, the root device will be discovered as a pingable device and you must manually change it to a Cisco Unified CM cluster.

- Select the *Cisco Cisco Unified CM Example* credential that you edited in the section on **Creating a Cisco Unified CM Credential..**

7. Click **[Next]**. The **Discovery Session Details** page of the **Add Devices** wizard appears:

8. Complete the following fields:
 - **List of IPs/Hostnames.** Type the IP addresses for the Cisco Unified CM Publishers.
 - **Which collector will monitor these devices?.** Required. Select an existing collector to monitor the discovered devices.
 - **Run after save.** Select this option to run this discovery session as soon as you save the session.
9. Click **[Save and Run]** if you enabled the Run after save setting, or **[Save and Close]** to save the discovery session. The **Discovery Sessions** page (Devices > Discovery Sessions) displays the new discovery session.
10. If you selected the **Run after save** option on this page, the discovery session runs, and the **Discovery Logs** page displays any relevant log messages. If the discovery session locates and adds any devices, the **Discovery Logs** page includes a link to the **Device Investigator** page for the discovered device.

NOTE: If you attempt to discover a CUCM cluster whose servers have been cloned from a separate CUCM cluster that has also been discovered within the same SL1 stack, the "Cisco: CUCM Subscriber Merge" Dynamic Application may incorrectly attempt to merge subscriber devices with components in another DCM tree. To avoid this, you must manually merge the subscriber server devices with their associated component devices in the correct cluster. The physical device of the CUCM Publisher should **not** be merged with its associated component device.

Discovering a CUCM Cluster in the SL1 Classic User Interface

When you use the *Cisco: CUCM Unified Communications Manager PowerPack* to discover Cisco Unified CM devices, SL1 creates a device representing your Cisco Unified CM cluster. This cluster device acts as the root device for the remaining servers and component devices in your Cisco Unified CM system.

To create and run a discovery session that will discover a Cisco Unified CM cluster:

1. Go to the **Discovery Control Panel** page (System > Manage > Classic Discovery).

- Click the **[Create]** button to create a new discovery session. The **Discovery Session Editor** window appears:

- Enter values in the following fields:

- IP Address/Hostname Discovery List.** Type the IP addresses for the Cisco Unified CM Publishers.

NOTE: To monitor Cisco Unified CM servers that are registered by name within their clusters, you might need to go to the **Host File Entry Manager** page (System > Customize > Host Files) and map the server names to their IP addresses if you do not have access to DNS for the Cisco Unified CM system you want to monitor. For Network Address Translation (NAT) environments, server hostnames should be mapped to external IP addresses. For more information, see the section [Manually Creating Host File Entries for Cisco Unified CM Nodes](#).

- SNMP Credential.** Select an SNMP credential to use with the Cisco Unified CM cluster. (For more information on SNMP credentials, see the **Discovery and Credentials** manual.)

NOTE: An SNMP credential is needed only to properly classify the devices in the cluster. If SNMP is not available on the Cisco Unified CM cluster, then you do not need to select an SNMP credential; in that scenario, the root device will be discovered as a pingable device and you must manually change it to a Cisco Unified CM cluster.

- **Other Credentials.** Select the *Cisco Cisco Unified CM Example* credential that you edited in the section on [Creating a Cisco Unified CM Credential](#).
4. You can enter values in the other fields on this page, but are not required to and can simply accept the default values. For more information about the other fields on this page, see the **Discovery and Credentials** manual.
 5. Click **[Save]** and then close the **Discovery Session Editor** window.
 6. The discovery session you created appears at the top of the **Discovery Control Panel** page. Click its lightning bolt icon () to run the discovery session.
 7. The **Discovery Session** window appears.
 8. When the Cisco Unified CM cluster is discovered, click its device icon () to view the **Device Properties** page for the Cisco Unified CM cluster.

NOTE: If you attempt to discover a CUCM cluster whose servers have been cloned from a separate CUCM cluster that has also been discovered within the same SL1 stack, the "Cisco: CUCM Subscriber Merge" DA may incorrectly attempt to merge subscriber devices with components in another DCM tree. To avoid this, you must manually merge the subscriber server devices with their associated component devices in the correct cluster. The physical device of the CUCM Publisher should **not** be merged with its associated component device.

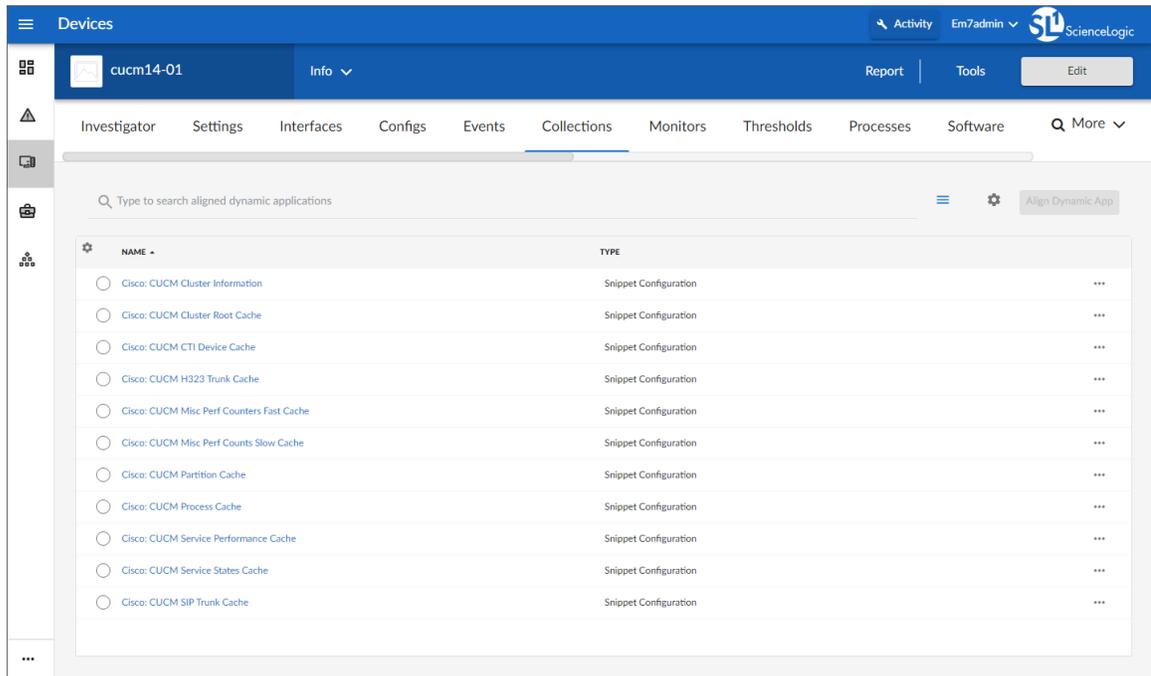

Verifying Discovery and Dynamic Application Alignment

The Dynamic Applications for monitoring Cisco Unified CM are aligned during discovery.

To verify that SL1 has automatically aligned the correct Dynamic Applications:

1. In the **Devices** page, locate the newly discovered Cisco Unified CM cluster and click on it to view the **Device Investigator** page.

- From the **Device Investigator** page for the Cisco Unified CM cluster, click the **[Collections]** tab. The **Dynamic Application Collections** page appears.

- The following Dynamic Applications should appear on the **Dynamic Application Collections** page for the Cisco Unified CM cluster:

NOTE: It can take several minutes after discovery for Dynamic Applications to display on the **Dynamic Application Collections** page. If the listed Dynamic Applications do not display on this page, try clicking the **[Reset]** button.

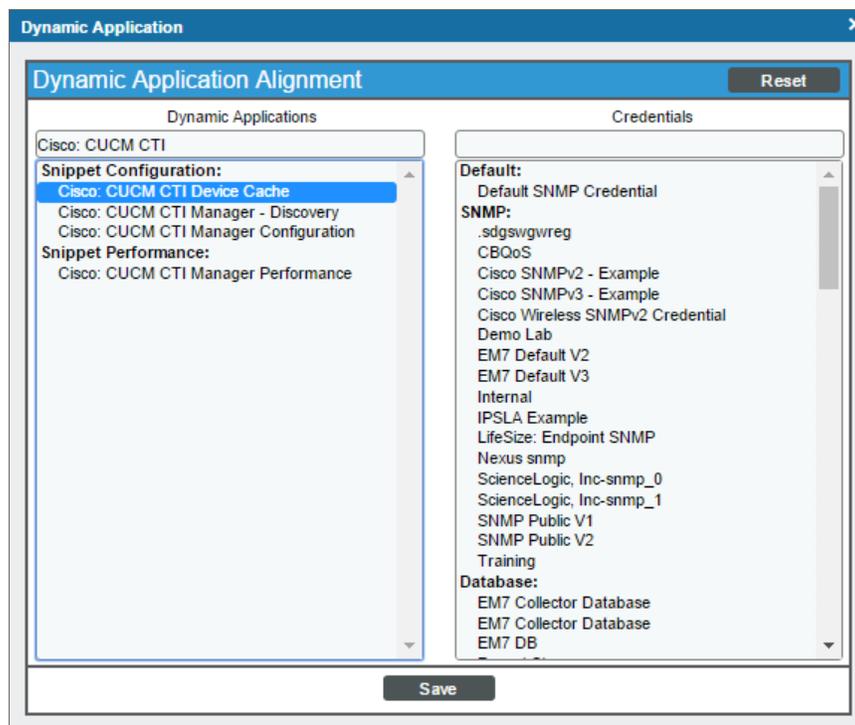

- Cisco: CUCM Cluster Information
- Cisco: CUCM Cluster Root Cache
- Cisco: CUCM CTI Device Cache
- Cisco: CUCM H323 Trunk Cache
- Cisco: CUCM Misc Perf Counters Fast Cache
- Cisco: CUCM Misc Perf Counts Slow Cache
- Cisco: CUCM Partition Cache
- Cisco: CUCM Process Cache
- Cisco: CUCM Service Performance Cache
- Cisco: CUCM Service States Cache
- Cisco: CUCM SIP Trunk Cache

Manually Aligning Dynamic Applications

If the Dynamic Applications have not been automatically aligned, you can align them manually.

To manually align Dynamic Applications:

1. From the **Device Manager** page (Devices > Device Manager), find the Cisco Unified CM cluster and click its wrench icon (🔧).
2. From the **Device Properties** page for the Cisco Unified CM cluster, click the **[Collections]** tab.
2. Click the **[Actions]** button and then click *Add Dynamic Applications*. The **Dynamic Application Alignment** page appears:

3. In the **Dynamic Applications** field, select the Dynamic Application you want to align.
4. In the **Credentials** field, select the SNMP credential you created for monitor the Cisco Unified CM cluster.
5. Repeat steps 2-4 for the remaining Dynamic Applications to align with the device.

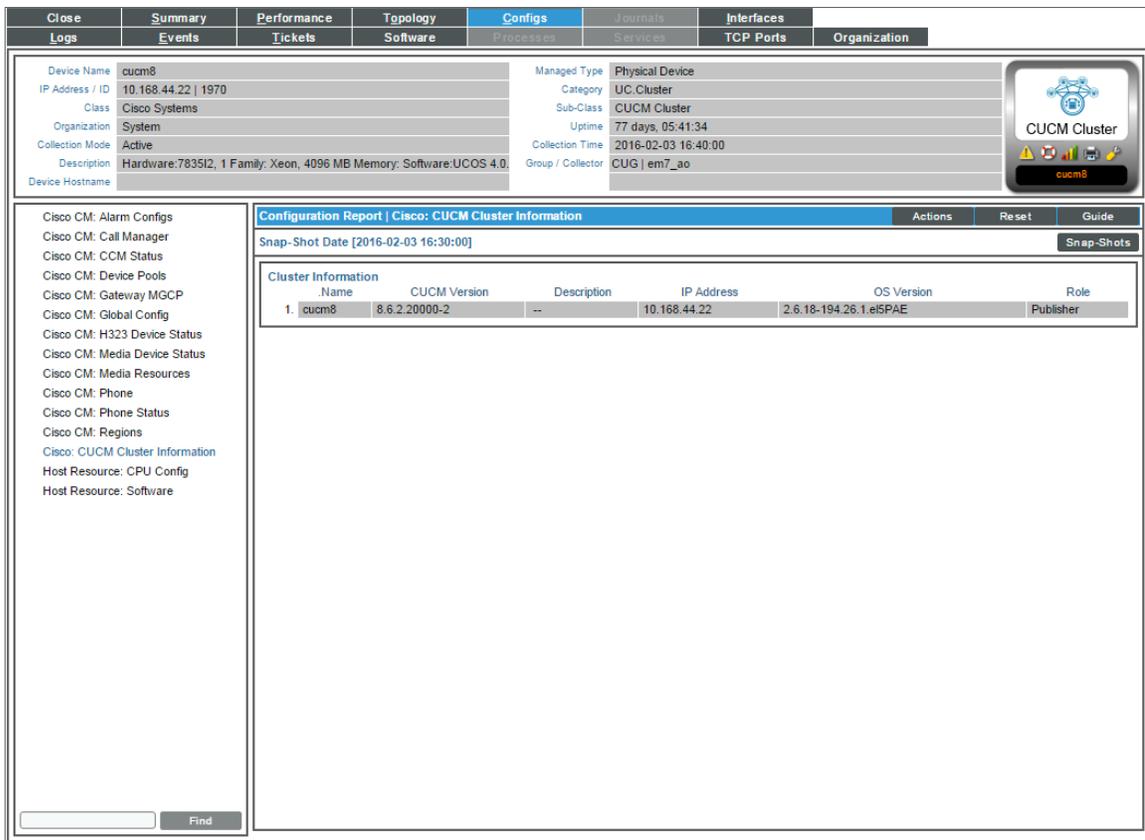

- After aligning the Dynamic Applications, click the **[Reset]** button and then click the plus icon (+) for the Dynamic Application. If collection for the Dynamic Application was successful, the graph icons (📊) for the Dynamic Application are enabled:

The screenshot shows the configuration page for a CUCM Cluster. The top section displays device details for 'cucm14-01', including IP address, class, organization, and collection mode. Below this is the 'Dynamic Application™ Collections' table, which lists various collection objects and their collection status.

Dynamic Application	ID	Poll Frequency	Type	Credential	Collector	Graph Icon
- Cisco: CUCM Cluster Information	407	15 mins	Snippet Configuration	Cisco CUCMv14	RNG-PATCH-E-CU	📊
Collection Object *						
Cluster Name				Cid	Found	Collecting
Cluster Information				o_3811	yes	yes
CUCM Version				o_3816	no	yes
Description				o_3809	yes	yes
Discovery Object				o_3812	yes	yes
Host				o_3817	no	yes
IOS Version				o_3810	yes	yes
Role				o_3814	yes	yes
Server Type				o_3815	yes	yes
Unique ID 1				o_3818	yes	yes
+ Cisco: CUCM Cluster Root Cache	406	15 mins	Snippet Configuration	Cisco CUCMv14	RNG-PATCH-E-CU	📊
+ Cisco: CUCM CTI Device Cache	438	15 mins	Snippet Configuration	Cisco CUCMv14	RNG-PATCH-E-CU	📊
+ Cisco: CUCM H323 Trunk Cache	471	15 mins	Snippet Configuration	Cisco CUCMv14	RNG-PATCH-E-CU	📊
+ Cisco: CUCM Misc Perf Counters Fast Cache	446	15 mins	Snippet Configuration	Cisco CUCMv14	RNG-PATCH-E-CU	📊
+ Cisco: CUCM Misc Perf Counts Slow Cache	379	15 mins	Snippet Configuration	Cisco CUCMv14	RNG-PATCH-E-CU	📊
+ Cisco: CUCM Partition Cache	493	15 mins	Snippet Configuration	Cisco CUCMv14	RNG-PATCH-E-CU	📊
+ Cisco: CUCM Process Cache	463	15 mins	Snippet Configuration	Cisco CUCMv14	RNG-PATCH-E-CU	📊
+ Cisco: CUCM Service Performance Cache	397	15 mins	Snippet Configuration	Cisco CUCMv14	RNG-PATCH-E-CU	📊
+ Cisco: CUCM Service States Cache	403	15 mins	Snippet Configuration	Cisco CUCMv14	RNG-PATCH-E-CU	📊
+ Cisco: CUCM SIP Trunk Cache	380	15 mins	Snippet Configuration	Cisco CUCMv14	RNG-PATCH-E-CU	📊

At the bottom of the table, there is a '[Select Action]' dropdown menu and a 'Go' button. Below the table is a 'Save' button.

- Click a graph icon () to view the collected data. The **Configuration Report** page will display the number of components of each type and the total number of components managed by the Cisco Unified CM cluster:

The screenshot shows the Cisco Unified CM Configuration Report page for a CUCM Cluster. The page is divided into several sections:

- Navigation Tabs:** Close, Summary, Performance, Topology, **Configs**, Journals, Interfaces, Logs, Events, Tickets, Software, PROVISION, Services, TCP Ports, Organization.
- Device Information:**
 - Device Name: cucm8
 - IP Address / ID: 10.168.44.22 | 1970
 - Class: Cisco Systems
 - Organization: System
 - Collection Mode: Active
 - Description: Hardware:7835I2, 1 Family: Xeon, 4096 MB Memory: Software:UCOS 4.0
 - Device Hostname: [blank]
 - Managed Type: Physical Device
 - Category: UC Cluster
 - Sub-Class: CUCM Cluster
 - Uptime: 77 days, 05:41:34
 - Collection Time: 2016-02-03 16:40:00
 - Group / Collector: CUG | em7_ao
- Configuration Report | Cisco: CUCM Cluster Information:**

Viewing Component Devices

When SL1 performs collection for a Cisco Unified CM cluster, SL1 will create component devices for the components in the Cisco Unified CM cluster and align other Dynamic Applications to those component devices. Some of the Dynamic Applications aligned to the component devices will also be used to create additional component devices. All component devices appear in the **Device Manager** page just like devices discovered using the ScienceLogic discovery process.

In addition to the **Devices** page, you can view the Cisco Unified CM cluster and all associated component devices in the following places in the user interface

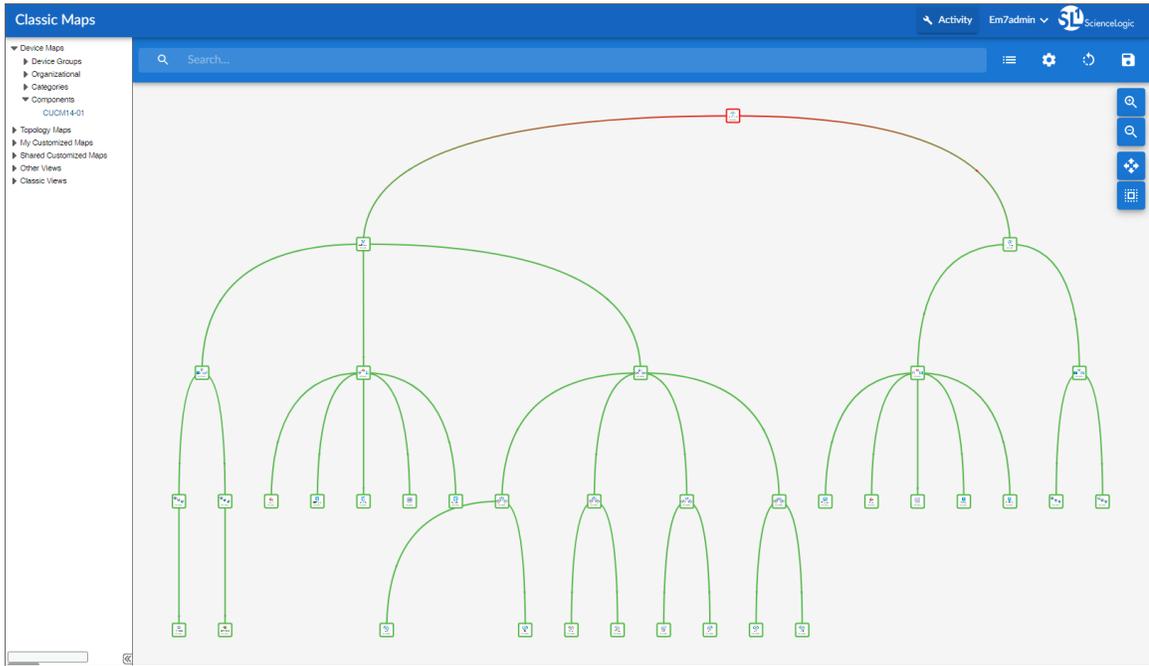

- The **Device Investigator** Map page (click **Map** in the **Device Investigator** page) displays a map of a particular device and all of the devices with which it has parent-child relationships. Double-clicking any of the listed devices reloads the page to make the selected device the primary device.

- The **Device Components** page (Devices > Device Components) displays a list of all root devices and component devices discovered by SL1. The **Device Components** page displays all root devices and component devices in an indented view, so you can easily view the hierarchy and relationships between child devices, parent devices, and root devices. To view the component devices associated with a Cisco Unified CM cluster, find the Cisco Unified CM cluster and select its plus icon (+).

Device Name	IP Address	Device Category	Device Class / Sub-class	DD	Organization	Current State	Collection Group	Collection State
1. - CUCM14-01	10.2.10.222	Cluster	Cisco Systems CUCM Cluster	34	CUCMv14	Critical	CUG2	Active
1. - CUCM14-01	--	CallControl	Cisco Systems Call Manager	35	CUCMv14	Healthy	CUG2	Active
1. - Devices	--	Device	Cisco Systems Device Container	37	CUCMv14	Healthy	CUG2	Active
1. - H323 Trunks	--	Trunk	Cisco Systems H323 Trunk Container	56	CUCMv14	Healthy	CUG2	Active
1. - FakeInterClusterTrunkNonGatekeeper	--	Trunk	Cisco Systems H323 Trunk	86	CUCMv14	Healthy	CUG2	Active
2. + SIP Trunks	--	Trunk	Cisco Systems SIP Trunk Container	55	CUCMv14	Healthy	CUG2	Active
2. + Media Resources	--	MediaResource	Cisco Systems Media Resource Container	39	CUCMv14	Healthy	CUG2	Active
3. + Services	--	Service	Cisco Systems Services Container	38	CUCMv14	Healthy	CUG2	Active
2. - CUCM14-02	--	CallControl	Cisco Systems Call Manager	36	CUCMv14	Healthy	CUG2	Active
1. - Devices	--	Device	Cisco Systems Device Container	41	CUCMv14	Healthy	CUG2	Active
1. - H323 Trunks	--	Trunk	Cisco Systems H323 Trunk Container	50	CUCMv14	Healthy	CUG2	Active
2. - SIP Trunks	--	Trunk	Cisco Systems SIP Trunk Container	54	CUCMv14	Healthy	CUG2	Active
2. - Services	--	Service	Cisco Systems Services Container	40	CUCMv14	Healthy	CUG2	Active

- The **Component Map** page (Classic Maps > Device Maps > Components) allows you to view devices by root node and view the relationships between root nodes, parent components, and child components in a map. This makes it easy to visualize and manage root nodes and their components. SL1 automatically updates the **Component Map** as new component devices are discovered. The platform also updates each map with the latest status and event information. To view the map for a Cisco Unified CM cluster, go to the **Component Map** page and select the map from the list in the left NavBar. To learn more about the **Component Map** page, see the **Maps** manual.

Dashboards in the SL1 Classic User Interface

Overview

The *Cisco: CUCM Unified Communications Manager PowerPack* comes paired with the *Cisco: CUCM Dashboards PowerPack*, which contains dashboards that present data related to different aspects of Cisco Unified CM clusters.

NOTE: These dashboards appear only in the SL1 classic user interface.

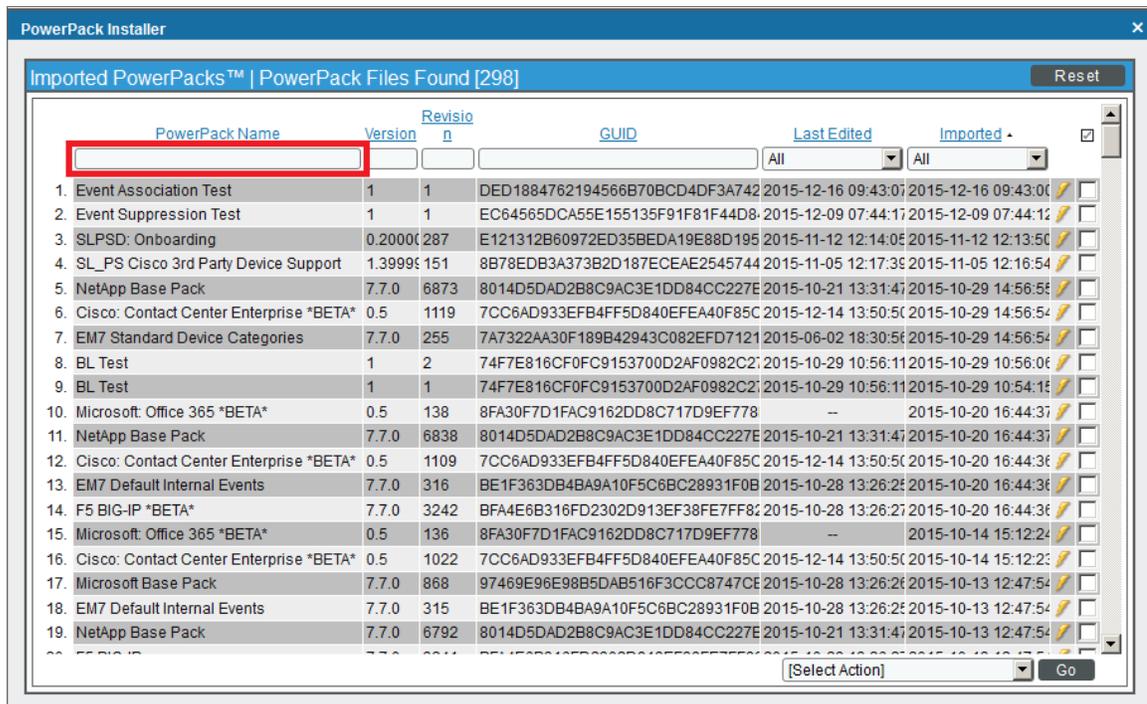

The following sections describe how to install the *Cisco: CUCM Dashboards PowerPack* and provide a description of each dashboard:

<i>Installing the CUCM Dashboards</i>	41
<i>Cisco: CUCM Performance Dashboard</i>	41
<i>Cisco: CUCM Locations LBM</i>	42
<i>Cisco: CUCM Media Resources</i>	43
<i>Cisco: CUCM Media Resources (Simple)</i>	44
<i>Cisco: CUCM Tomcat</i>	45
<i>Cisco: CUCM Overall Cluster Health</i>	46
<i>Cisco: CUCM Active Calls</i>	47

Installing the CUCM Dashboards

To view the Cisco Unified CM dashboards in SL1, you must install the *Cisco: CUCM Dashboards* PowerPack. To do so:

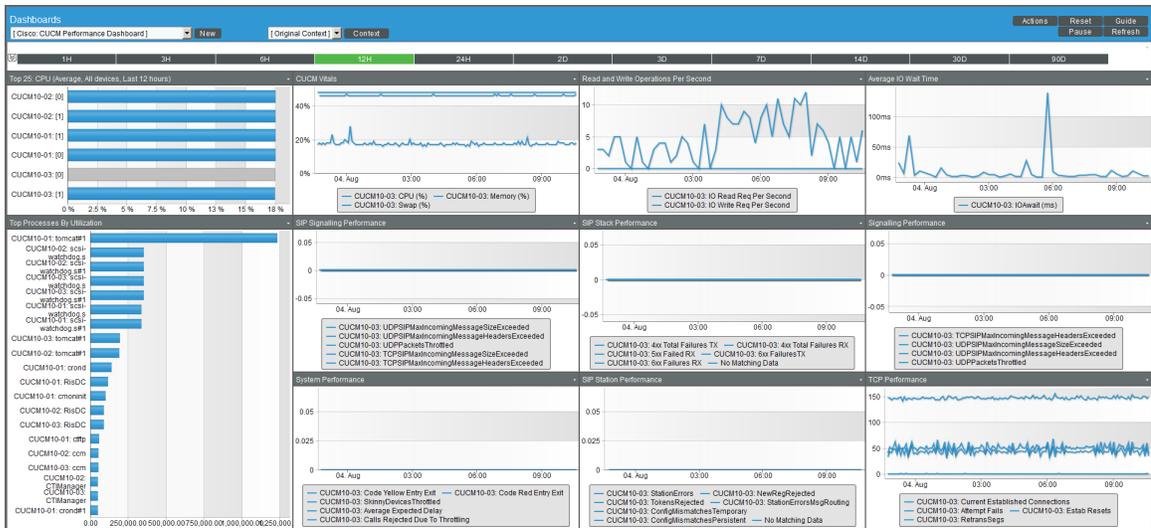

1. Go to the **PowerPack Manager** page (System > Manage > PowerPacks).
2. Click the **[Actions]** button, then select *Install PowerPack*. The **Imported PowerPacks** modal page appears.
3. Use the search filter in the **PowerPack Name** column heading to locate the PowerPack you want to install. To do so, enter text to match, including special characters, and the **Imported PowerPacks** modal page displays only PowerPacks that have a matching name.

4. Click the lightning-bolt icon (⚡) for the PowerPack that you want to install.
5. The **Install PowerPack** modal page appears. To install the PowerPack, click **[Install]**.
6. The PowerPack now appears in the **PowerPack Manager** page. The contents of the PowerPack are automatically installed in your SL1 System.

Cisco: CUCM Performance Dashboard

The Cisco: CUCM Performance dashboard displays 11 widgets.

The dashboard includes the following widgets:

- **Top 25: CPU (Average, All devices, Last 12 Hours).** This widget displays a bar graph that depicts the 25 Cisco CallManager devices that used the highest percentage of CPU time over the last 12 hours.
- **Top Processes By Utilization.** This widget displays a bar graph that depicts all Cisco Unified CM processes in the cluster, ordered by utilization from highest to lowest.
- **CUCM Vitals.** This widget displays a line graph that depicts the cluster's vitals by percent, including CPU time, Swap Utilization, and Memory Utilization, over time.
- **Read and Write Operations Per Second.** This widget displays a line graph that depicts read and write requests per second over time.
- **Average IO Wait Time.** This widget displays a line graph that depicts the average IO wait time over time.
- **SIP Signaling Performance.** This widget displays a line graph that depicts SIP signaling performance over time.
- **SIP Stack Performance.** This widget displays a line graph that depicts SIP stack performance over time.
- **Signaling Performance.** This widget displays a line graph that depicts overall signaling performance over time.
- **System Performance.** This widget displays a line graph that depicts multiple system performance metrics over time.
- **SIP Station Performance.** This widget displays a line graph that depicts multiple SIP station performance metrics over time.
- **TCP Performance.** This widget displays a line graph that depicts TCP performance over time.

Cisco: CUCM Locations LBM

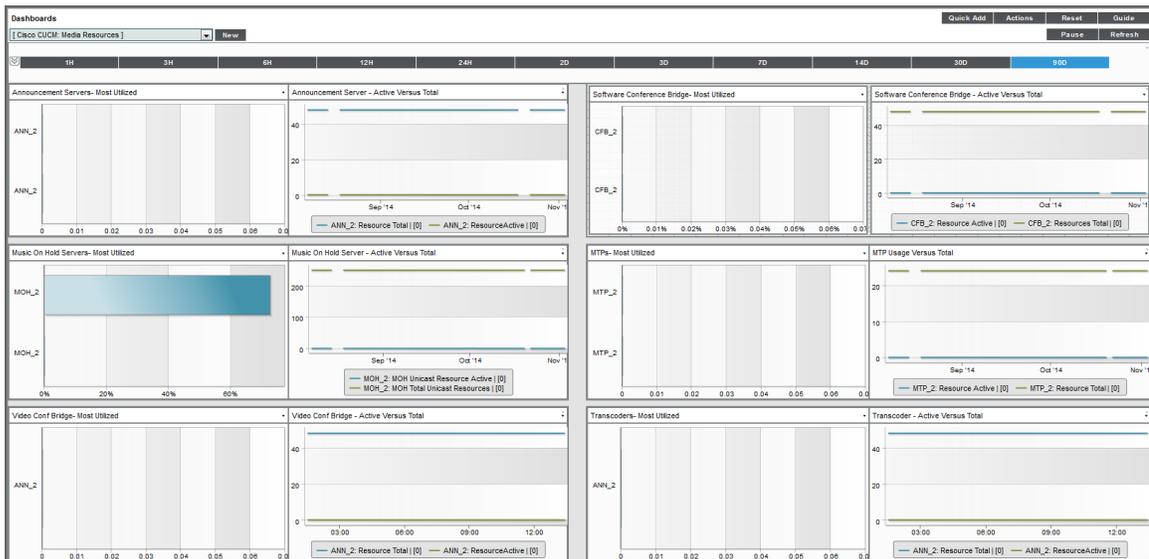

The Cisco: CUCM Locations LBM (Location Bandwidth Manager) dashboard displays eight widgets.

The dashboard includes the following widgets:

- **Top Locations by Audio Bandwidth.** This widget displays a horizontal bar graph that depicts a list of locations, ordered by audio bandwidth usage by percent, from highest to lowest.
- **Location - Audio Bandwidth Utilization.** This widget displays a line graph that depicts audio bandwidth utilization over time.
- **Top Locations by Available Bandwidth.** This widget displays a horizontal bar graph that depicts a list of locations, ordered by available bandwidth in kpbs, from highest to lowest.
- **Location - Available Bandwidth.** This widget displays a line graph that depicts available bandwidth over time.
- **Top Locations by Video Bandwidth.** This widget displays a line graph that a list of locations, ordered by video bandwidth by percent, from highest to lowest.
- **Location - Video Bandwidth Utilization.** This widget displays a line graph that depicts video bandwidth utilization over time.
- **Top Locations by Telepresence Bandwidth Utilization.** This widget displays a horizontal bar graph that depicts a list of locations, ordered by TelePresence bandwidth usage in percent, from highest to lowest.
- **Location - Telepresence BW Utilization.** This widget displays a line graph that depicts TelePresence bandwidth utilization over time.

Cisco: CUCM Media Resources

The Cisco: CUCM Media Resources dashboard displays 12 widgets that display the most utilized and active versus total metrics for transcoding, announcement servers, streaming music to callers on hold, video, conferencing, and media termination points.

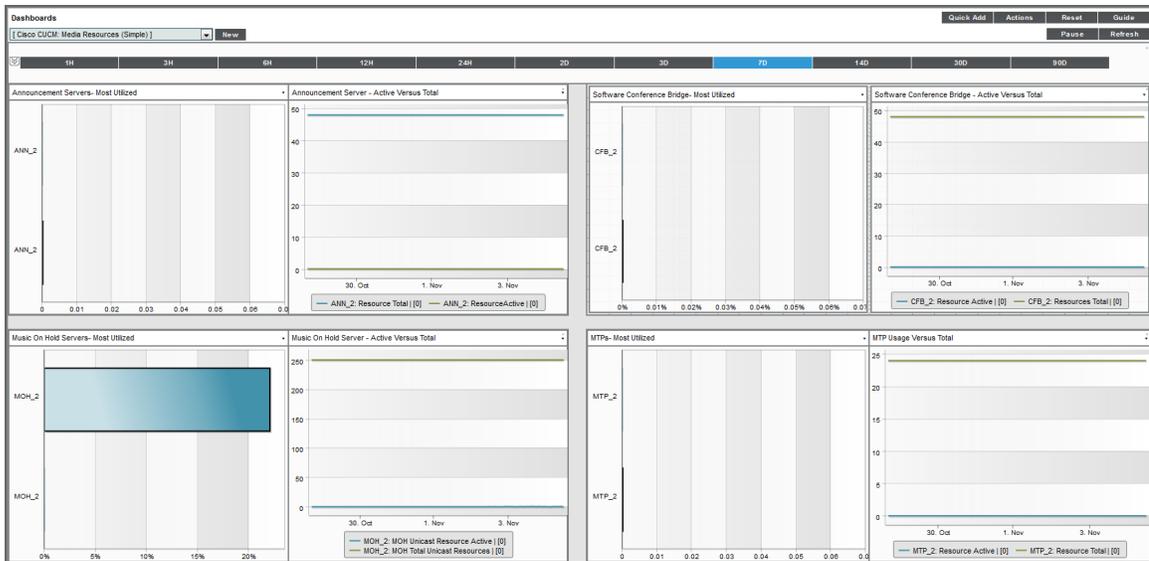

The dashboard includes the following widgets:

- **Announcement Servers - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized announcement servers.
- **Announcement Server - Active Versus Total.** This widget displays a line graph that depicts the active announcement servers versus the total announcement servers over time.
- **Software Conference Bridge - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized software conference bridges by percent.
- **Software Conference Bridge - Active Versus Total.** This widget displays a line graph that depicts the active versus total software conference bridges over time.
- **Music On Hold Servers - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized music-on-hold servers by percent.
- **Music On Hold Servers - Active Versus Total.** This widget displays a line graph that depicts the active versus total music-on-hold servers over time.
- **MTPs - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized Media Transfer Protocols (MTPs) by percent.
- **MTP Usage Versus Total.** This widget displays a line graph that depicts the usage versus total Media Transfer Protocols (MTPs) over time.
- **Video Conf Bridge - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized video conference bridges by percent.
- **Video Conf Bridge - Active Versus Total.** This widget displays a line graph that depicts the active versus total video conference bridges over time.
- **Transcoders - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized transcoders by percent.
- **Transcoders - Active Versus Total.** This widget displays a line graph that depicts the active versus total transcoders over time.

Cisco: CUCM Media Resources (Simple)

The Cisco: CUCM Media Resources dashboard displays eight widgets which display the most utilized and active versus total metrics for announcement servers, streaming music to callers on hold, conferencing, and media termination points.

The dashboard includes the following widgets:

- **Top SIP Trunks by Number of Active Calls.** This widget displays a horizontal bar graph that depicts the most utilized SIP trunks.
- **SIP Trunk Active Calls (Per Trunk).** This widget displays a line graph that depicts the number of active calls per SIP Trunk over time.
- **Software Conference Bridge - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized software conference bridges by percent.
- **Software Conference Bridge - Active Versus Total.** This widget displays a line graph that depicts the active versus total software conference bridges over time.
- **Music On Hold Servers - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized music-on-hold servers by percent.
- **Music On Hold Servers - Active Versus Total.** This widget displays a line graph that depicts the active versus total music-on-hold servers over time.
- **MTPs - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized Media Transfer Protocols (MTPs) by percent.
- **MTP Usage Versus Total.** This widget displays a line graph that depicts the usage versus total Media Transfer Protocols (MTPs) over time.

Cisco: CUCM Tomcat

The Cisco: CUCM Tomcat dashboard displays 12 widgets that monitor servers and services that use the Tomcat Java Webserver.

The dashboard includes the following widgets:

- **Tomcat - Top Servers by Number of Requests.** This widget displays a horizontal bar graph that depicts the servers with the highest number of requests.
- **Tomcat % Memory Utilization.** This widget displays a line graph that depicts the percentage of memory utilization over time.
- **Tomcat % Total Errors.** This widget displays a line graph that depicts the percentage of errors over time.
- **Tomcat Connector - Total Sessions Active.** This widget displays a line graph that depicts the total active Tomcat Connector sessions over time.
- **Tomcat - Top 10 Services By Number of Requests.** This widget displays a horizontal bar graph that depicts the ten services with the most requests.
- **Tomcat - Number of Requests (Per Service).** This widget displays a line graph that depicts the number of requests per service over time.
- **Tomcat - Top 10 Services by Errors.** This widget displays a horizontal bar graph that depicts the ten services with the most errors.
- **Tomcat - Errors (Per Service).** This widget displays a line graph that depicts errors per service over time.
- **Tomcat - Top 5 Services by Sessions Active.** This widget displays a horizontal bar graph that depicts the five services with the most active sessions.
- **Tomcat - Sessions Active.** This widget displays a line graph that depicts active Tomcat sessions over time.
- **Tomcat - Top Connectors By Errors/Threads Busy.** This widget displays a horizontal bar graph that depicts the Connectors with the most errors and busy threads.
- **Tomcat - Connector Errors or Threads Busy (Per Connector).** This widget displays a line graph that depicts connector errors or busy threads per connector over time.

Cisco: CUCM Overall Cluster Health

The Cisco: CUCM Overall Cluster Health dashboard contains nine widgets that monitor aspects of the cluster's overall health.

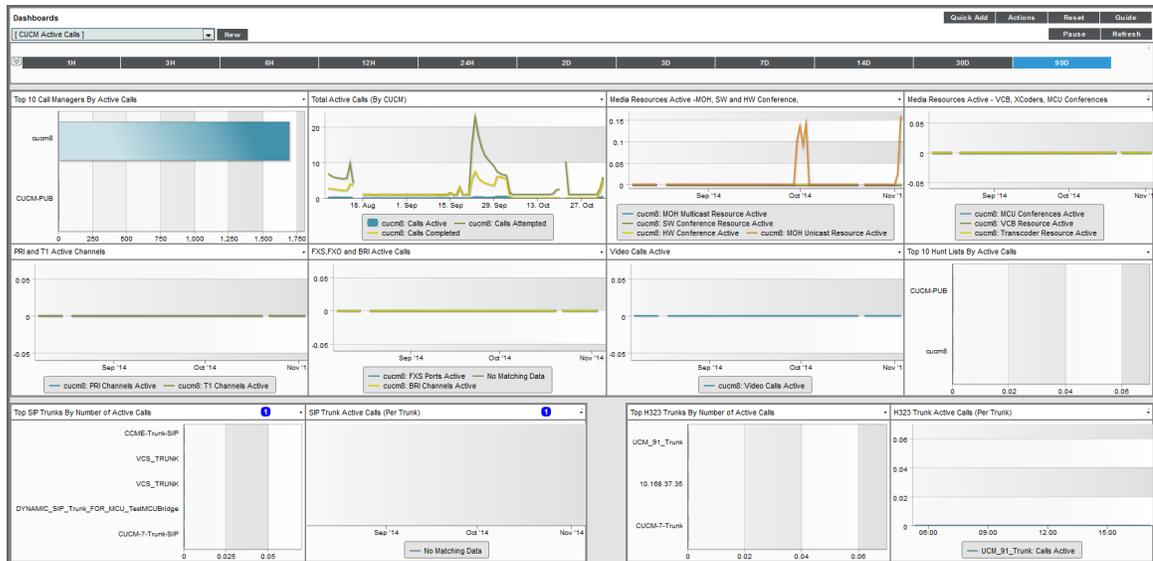

The dashboard includes the following widgets:

- Eight gauge widgets use IT Service Monitor Policies to display the following:
 - Cluster Health
 - Trunk Health
 - Gateway Health
 - Media Resources Health
 - Cluster Call Completions
 - CUCM Server Health
 - TFTP Health
 - Tomcat Health
- At the bottom of the dashboard, a line graph depicts the overall cluster health by percentage over time.

Cisco: CUCM Active Calls

The Cisco: CUCM Active Calls widget displays 12 graphs that monitor active calls, conferences, and active channels.

The widgets display:

- **Top 10 Call Managers By Active Calls.** This widget displays a horizontal bar graph that depicts the ten call managers with the highest number of active calls.
- **Total Active Calls (By CUCM).** This widget displays a line graph that depicts total active calls by CUCM over time.
- **Media Resources Active - MOH, SW and HW Conferences.** This widget displays a line graph that depicts active MOH, SW, and HW conference media resources over time.
- **Media Resources Active - VCB, Xcoders, MCU Conferences.** This widget displays a line graph that depicts active VCB, Xcoders, and MCU conferences over time.
- **PRI and T1 Active Channels.** This widget displays a line graph that depicts the active PRI and T1 channels over time.
- **FXS, FXO, and BRI Active Calls.** This widget displays a line graph that depicts FXS, FXO, and BRI active calls over time.
- **Video Calls Active.** This widget displays a line graph that depicts active video calls over time.
- **Top 10 Hunt Lists By Active Calls.** This widget displays a horizontal bar graph that depicts the ten hunt lists with the highest number of active calls.
- **Top SIP Trunks By Number of Active Calls.** This widget displays a horizontal bar graph that depicts the SIP trunks with the highest number of active calls.
- **SIP Trunk Active Calls (Per Trunk).** This widget displays a line graph that depicts active SIP trunk calls over time.
- **Top H323 Trunks By Number of Active Calls.** This widget displays a horizontal bar graph that depicts the H323 trunks with the highest number of active calls.
- **H323 Trunk Active Calls (Per Trunk).** This widget displays a line graph that depicts active H323 trunk calls over time.

Troubleshooting

Overview

The following sections describe resolutions to some issues you might encounter when monitoring Cisco Unified Communications Manager:

<i>Resolving Network Connectivity Issues</i>	49
<i>Resolving Credential Issues</i>	50
<i>Basic/Snippet (AXL User) Credentials</i>	50
<i>SNMP Credentials</i>	51
<i>Resolving NAT Issues</i>	51
<i>Resolving Error Messages</i>	51
<i>Running Dynamic Applications in Debug Mode</i>	52

Resolving Network Connectivity Issues

If you experience network connectivity issues, you can follow the steps in this section to diagnose the cause.

To diagnose network connectivity issues:

1. Use a Secure Shell (SSH) client software such as PuTTY to log in to the ScienceLogic Data Collector.
2. Type the following command:

```
ping <Cisco Unified CM Server IP>
```

If this fails, check to see if the network is blocking ICMP traffic anywhere, as this might identify a firewall that is not documented.

3. Type the following command:

```
nmap -sU -Pn -p 161 <Cisco Unified CM Server IP>
```

This will validate whether or not you have SNMP connectivity. If you do not, you might be on an access control list (ACL).

4. Type the following command:

```
nmap -sS -Pn -p 8443 <Cisco Unified CM Server IP>
```

This will determine if you have AXL connectivity.

5. Type the following command:

```
tracert <Cisco Unified CM Server IP>
```

This will identify any additional unknown firewalls or unexpected routing paths.

If you cannot identify the causes of your network connectivity issues using these steps, you might be experiencing a DNS resolution issue. For more information, see the [Manually Creating Host File Entries for CUCM Nodes](#) section.

Resolving Credential Issues

Basic/Snippet (AXL User) Credentials

The following list includes commands that you can use to validate your Basic/Snippet Cisco Unified CM credentials:

- To validate that the credential can communicate with the AXL API service:

```
curl -k -u <USER>:<PASSWORD> -H "Content-type: text/xml;" https://<Cisco Unified CM Server IP>:8443/axl/services/AXLAPIService?wsdl
```

- To validate that the credential can communicate with the Real Time Information port:

```
curl -k -u <USER>:<PASSWORD> -H "Content-type: text/xml;" https://<Cisco Unified CM Server IP>:8443/realtimeservice/services/RisPort?wsdl
```

- To validate that the credential can communicate with the Performance Monitor port:

```
curl -k -u <USER>:<PASSWORD> -H "Content-type: text/xml;" https://<Cisco Unified CM Server IP>:8443/perfmonservice/services/PerfmonPort?wsdl
```

- To validate that the credential can communicate with the Control Center service port:

```
curl -k -u <USER>:<PASSWORD> -H "Content-type: text/xml;" https://<Cisco Unified CM Server IP>:8443/controlcenterservice/services/ControlCenterServicesPort?wsdl
```

SNMP Credentials

You can use the following commands to validate your SNMP credentials:

- For SNMP v2:

```
snmpwalk -v 2c -c <read string> <Cisco Unified CM Server IP> system
```

- For SNMP v3:

```
snmpwalk -v3 -1 authNoPriv -u <username> -a SHA -A <password> <Cisco Unified CM Server IP>
```

Resolving NAT Issues

NOTE: See the section [Configuring CUCM for NAT](#) for steps on enabling support for network address translation (NAT).

If a customer must have a firewall between the ScienceLogic Data Collector and the Cisco Unified CM Cluster, then check the firewall to determine if the firewall is performing network address translation (NAT).

If NAT is enabled:

1. The customer must provide a hostname and an IP address accessible from the Data Collector for the Cluster and each subscribing CallManager.
2. Add the CallManager hostnames and IP addresses to host file entries. (For more information, see the [Manually Creating Host File Entries for CUCM Nodes](#) section.)
3. Allow time for the host file to be propagated to the Data Collector.

NOTE: You can also follow these instructions if the CallManager is defined by an IP address but not a hostname.

If you have enabled support for NAT and set the "Use Server Hostname for NAT" threshold object to "1", but are experiencing collection issues after upgrading the PowerPack, the threshold may have been reset. To avoid this happening during a PowerPack upgrade, go to the **Behavior Settings** page (System > Settings > Behavior) and click the **Enable Selective PowerPack Field Protection** checkbox.

Resolving Error Messages

The following error message might be generated during collection for the Cisco Unified Communications Manager Dynamic Applications.

Error / Message	Cause / Resolution
When running the "Cisco: CUCM Cluster Root Cache" Dynamic Application, you receive an error message stating "[Application number, snippet number] reported a collection problem. (Explanation: The server is not specified as a Publisher.)"	SL1 cannot determine the node's IP address. You must add the node hostname and IP address to a host file. (For more information, see the Manually Creating Host File Entries for CUCM Nodes section.)

Running Dynamic Applications in Debug Mode

To identify issues with a specific Dynamic Application, go to the **Dynamic Application Collections** page (Registry > Devices > wrench icon > Collections) and run the Dynamic Application by clicking its lightning bolt icon (). Doing so provides you with details about any issues the Dynamic Application might be experiencing with the provided URL, IP address, or credentials.

Another method, which will provide even more data, is to run the Dynamic Application in debug mode. To run a Dynamic Application in debug mode, type the following command from the command line interface for the Data Collector:

```
sudo -u s-em7-core SILO_DEBUG=1 /opt/em7/backend/dynamic_single.py <device ID>
<Dynamic Application ID>
```
