Chapter

Introduction

Overview

This chapter describes how to monitor a Cisco Unified Communications Manager (CM) system in SL1.

The following sections provide an overview of Cisco Unified CM and the Cisco: CUCM Unified Communications Manager PowerPack:

What is Cisco Unified Communications Manager?	3
What Does the Cisco: CUCM Unified Communications Manager PowerPack Monitor?	4
Supported Versions	4
Installing the Cisco: CUCM Unified Communications Manager PowerPack	4

NOTE: ScienceLogic provides this documentation for the convenience of ScienceLogic customers. Some of the configuration information contained herein pertains to third-party vendor software that is subject to change without notice to ScienceLogic. ScienceLogic makes every attempt to maintain accurate technical information and cannot be held responsible for defects or changes in third-party vendor software. There is no written or implied guarantee that information contained herein will work for all third-party variants. See the End User License Agreement (EULA) for more information.

What is Cisco Unified Communications Manager?

Cisco Unified Communications Manager, also known as CallManager, is a unified call control and communications platform that provides services such as session management, voice, video, messaging, mobility, and web conferencing. Multiple CallManager servers can be grouped together into a cluster, which enables the CallManagers to share resources and features for better system scalability.

What Does the Cisco: CUCM Unified Communications Manager PowerPack Monitor?

To monitor Cisco Unified CM using SL1, you must install the Cisco: CUCM Unified Communications Manager PowerPack. This PowerPack enables you to discover, model, and collect data about your Cisco Unified CM system and clusters.

The Cisco: CUCM Unified Communications Manager PowerPack includes:

- An example credential you can use as a template to create a Basic/Snippet credential to connect to the Cisco Unified CM clusters you want to monitor
- Dynamic Applications to discover, model, and monitor performance metrics and collect configuration data for Cisco Unified CM clusters
- Device Classes for each of the Cisco Unified CM clusters that SL1 monitors
- Event Policies and corresponding alerts that are triggered when Cisco Unified CM clusters meet certain status criteria
- Dashboards that display graphical information about Cisco Unified CM clusters
- Run Book Actions and Run Book Automation policies that assign the Cisco Unified CM cluster root device to the appropriate Device Class, merge subscriber and physical component devices, and clear any unregistration events for a device when the same device is registered on another node in the cluster

NOTE: The Run Book Action that assigns the root device disables the Cisco Unified CM cluster root device's **Auto-Update** option.

Supported Versions

You can use this PowerPack to configure versions 12.x and 14.x of Cisco Unified CM.

Installing the Cisco: CUCM Unified Communications Manager PowerPack

Before completing the steps in this manual, you must import and install the latest version of the Cisco: CUCM Unified Communications Manager PowerPack.

TIP: By default, installing a new version of a PowerPack overwrites all content from a previous version of that PowerPack that has already been installed on the target system. You can use the *Enable Selective PowerPack Field Protection* setting in the **Behavior Settings** page (System > Settings > Behavior) to prevent new PowerPacks from overwriting local changes for some commonly customized fields. (For more information, see the *System Administration* manual.)

To download and install a PowerPack:

- 1. Download the PowerPack from the <u>ScienceLogic Support Site</u>.
- 2. Go to the **PowerPack Manager** page (System > Manage > PowerPacks).
- 3. In the **PowerPack Manager** page, click the **[Actions]** button, then select Import PowerPack.
- 4. The Import PowerPack dialog box appears:

Import PowerPack™	×
Browse for file Browse License: Import	

- 5. Click the [Browse] button and navigate to the PowerPack file.
- 6. When the **PowerPack Installer** modal appears, click the **[Install]** button to install the PowerPack.

NOTE: If you exit the **PowerPack Installer** modal without installing the imported PowerPack, the imported PowerPack will not appear in the **PowerPack Manager** page. However, the imported PowerPack will appear in the **Imported PowerPacks** modal. This page appears when you click the **[Actions]** menu and select *Install PowerPack*.

2

Configuration and Credentials

Overview

The following sections describe how to configure a Cisco Unified Communications Manager (CM) system for monitoring by SL1 using the Cisco: CUCM Unified Communications Manager PowerPack:

Prerequisites for Monitoring CUCM	6
Configuring the ScienceLogic Platform to Monitor CUCM	7
Configuring CUCM for NAT	10
Enabling the CUCM AXL Web Service	10
Configuring a CUCM User Account	12
Configuring Prime License Manager	18
Creating a CUCM Credential	20
Creating a CUCM Credential in the SL1 Classic User Interface	21
Testing the CUCM Credential	22
Manually Creating Host File Entries for CUCM Nodes	24

Prerequisites for Monitoring CUCM

During the discovery process, SL1 automatically aligns the IP addresses and hostnames for each node in a Cisco Unified CM cluster via DNS.

If you do not have access to DNS for the Cisco Unified CM systems that you want to monitor with SL1, ensure that you know or have access to the following information about each node:

- IP address
- Hostname

Configuring the ScienceLogic Platform to Monitor CUCM

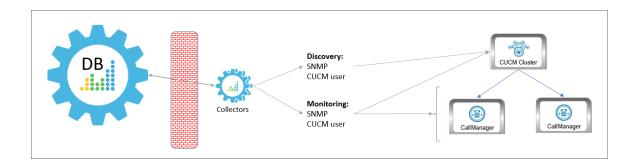

You can choose from several different possible configurations when using SL1 to monitor Cisco Unified CM:

- You can have the ScienceLogic Data Collector either in front of a firewall or behind a firewall.
- You can define the CallManager nodes either by hostname or by IP address in the Cisco Unified CM database.
- In some scenarios, you can also use network address translation (NAT) when defining the CallManagers.

These various methods are described in this section.

Method 1

In the first scenario, the Data Collector sits in front of the firewall and you define the CallManagers by hostname:

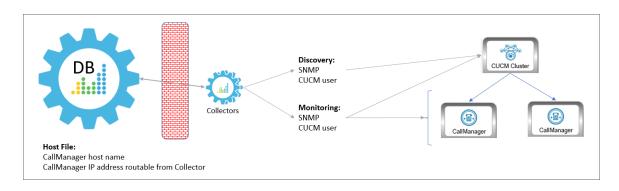

In this scenario, you must have the following ports open for the firewall:

Direction	Port	Protocol
ScienceLogic Database Server to the Data Collector	7707	ТСР
PhoneHome Collector to the Database Server	7705	ТСР

Method 2

In the second scenario, the Data Collector sits in front of the firewall and you define the CallManagers by IP address. This method requires you to create a host file that includes the CallManager hostname and IP address:

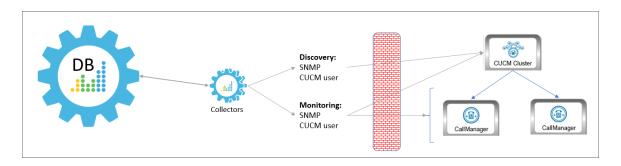

In this scenario, you must have the following ports open for the firewall:

Direction	Port	Protocol
ScienceLogic Database Server to the Data Collector	7707	ТСР
PhoneHome Collector to the Database Server	7705	ТСР

Method 3

In the third scenario, the Data Collector sits behind the firewall and you define the CallManagers by hostname:

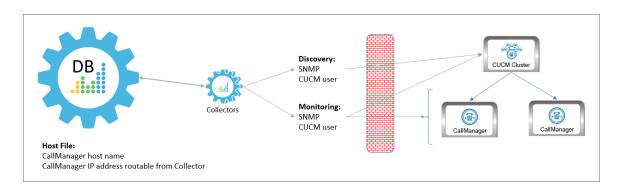

In this scenario, you must have the following ports open for the firewall:

Direction	Credential	Port	Protocol
ScienceLogic Data Collector to the Cisco Unified CM Cluster and	SNMP	161	UDP
CallManagers	Cisco Unified CM user	8443	ТСР

Method 4

In the fourth scenario, the Data Collector sits behind the firewall and you define the CallManagers by hostname, with NAT. This method requires you to create a host file that includes the CallManager hostname and the IP address the Data Collector can use to access the device:

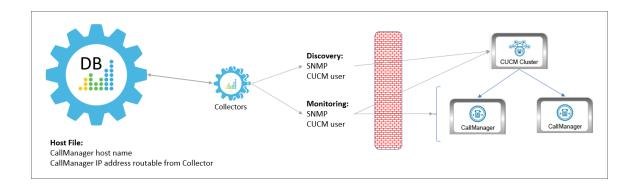

In this scenario, you must have the following ports open for the firewall:

	Direction	Credential	Port	Protocol
	ScienceLogic Data Collector to the Cisco Unified CM Cluster and	SNMP	161	UDP
		Cisco Unified CM user	8443	ТСР

Method 5

In the final scenario, the Data Collector sits behind the firewall and you define the CallManagers by IP address, with NAT. This method requires you to create a host file that includes the CallManager host name and IP address the Data Collector can use to access the device:

NOTE: This method is not supported by versions of the Cisco: CUCM Unified Communications Manager PowerPack prior to version 109.

In this scenario, you must have the following ports open for the firewall:

Direction	Credential	Port	Protocol
ScienceLogic Data Collector to the Cisco Unified CM Cluster and	SNMP	161	UDP
CallManagers	Cisco Unified CM user	8443	ТСР

Configuring CUCM for NAT

If you are using Network Address Translation (NAT) in your environment, you will need to adjust a threshold in the "Cisco: CUCM Cluster Information" Dynamic Application to enable NAT support.

To configure the threshold object:

- 1. Go to the Dynamic Applications Manager page (System > Manage > Dynamic Applications).
- 2. Locate the "Cisco: CUCM Cluster Information" Dynamic Application and click its wrench icon (🥍).
- 3. In the Dynamic Applications Properties Editor, click the [Thresholds] tab.
- 4. Click the wrench icon (*for the "Use Server Hostname for NAT" threshold object.*
- 5. Ensure that the **Override Threshold Value** field is set to Enabled.
- 6. In the *Threshold Value* field, type "1".
- 7. Click [Save].

Enabling the CUCM AXL Web Service

SL1 can monitor a Cisco Unified CM system by requesting detailed information about the system from the Cisco Unified CM AXL Web Service.

The Cisco Unified CM AXL web service is disabled by default. To enable the AXL web service, perform the following steps:

1. In a browser window, navigate to the following address:

https://ip-address-of-CM-system:8443/ccmadmin/showHome.do

2. Log in to the Cisco Unified CM Administration site as an administrator.

3. In the **Navigation** drop-down list at the top-right corner of the page, select Cisco Unified Serviceability, and then click the **[Go]** button. The **Cisco Unified Serviceability** page appears:

4. In the navigation bar at the top-left of the page, hover over **Tools**, then select **Service Activation**. The **Service Activation** page appears:

cisco

	Cisco IP Manager Assistant	Activated
	Cisco WebDialer Web Service	Activated

- 5. In the **Server** drop-down list, select the Cisco Unified CM server for which you want to enable the AXL web service, and then click the **[Go]** button.
- 6. In the list of services, locate the **Database and Admin Services** section. If the Activation Status of the **Cisco AXL Web Service** is "Activated", the AXL web service is already enabled.
- 7. If the Activation Status of the Cisco AXL Web Service is not "Activated", select the checkbox for the Cisco AXL Web Service.

8. Click the **[Save]** button at the bottom of the page to save your changes, and then click the **[OK]** button in the pop-up window that appears.

Configuring a CUCM User Account

ScienceLogic recommends that you create a Cisco Unified CM user account that will be used only by SL1 to access the AXL web service. To create a user account in Cisco Unified CM that can access only the AXL web service, perform these two steps:

- Create a user account.
- Create a user group that includes the user account and has permission to access only the AXL web service.

To create a new Cisco Unified CM user group and user account, perform the following steps:

- In a browser window, navigate to the following address: https://ip-address-of-CM-system:8443/ccmadmin/showHome.do
- 2. Log in to the Cisco Unified CM Administration site as an administrator.
- 3. In the navigation bar at the top-left of the page, hover over **User Management**, then select **Application User**. The **Find and List Users** page appears:

Configuring Prime License Manager

If you want to monitor Cisco Unified CM license information from Cisco Prime License Manager (PLM), you must create an administrator user account that SL1 can use to access PLM.

To create an administrator user in PLM:

1. In a browser window, navigate to the following address:

https://ip-address-of-plm-server/elm-admin/

- 2. Log in to the Cisco PLM site as an administrator.
- 3. In the Administration drop-down menu, select Administrator Accounts.

4. Click the [Add Administrator] button.

5. In the Add Administrator Account modal page, make entries in the following fields:

Add Administrator Acc	count	х
- The minimum password l	ength is 1.	
Name/Description:]
*Username:]
*Password:]
*Re-enter Password:]
	(OK Cancel

- Name/Description. Type a name or description for the account.
- Username. Type the account username.
- **Password**. Type the account password.
- Re-enter Password. Type the account password again.

6. Click [OK].

Creating a CUCM Credential

To use the Dynamic Applications in the Cisco: CUCM Unified Communications Manager PowerPack, you must first define a Basic/Snippet Cisco Unified CM credential in SL1. This credential allows SL1 to communicate with the Cisco Unified CM cluster. The Cisco: CUCM Unified Communications Manager PowerPack includes a template you can use to create this Basic/Snippet credential.

NOTE: If you are using an SL1 system prior to version 11.1.0, the new user interface does not include the Duplicate option for sample credential(s). ScienceLogic recommends that you use the classic user interface and the Save As button to create new credentials from sample credentials. This will prevent you from overwriting the sample credential(s).

To modify the Cisco Unified CM Basic/Snippet Credential template for use with your Cisco Unified CM cluster:

- 1. Go to the **Credentials** page (Manage > Credentials).
- 2. Locate the "Cisco CUCM Example" sample credential. Click its **[Actions]** icon (---) and select **Duplicate**. A copy of the credential, called **Cisco CUCM Example copy** appears.
- 3. Click the [Actions] icon (--) for the Cisco CUCM Example copy credential and select *Edit*. The Edit Credential page appears:

Name* Cisco CUCM Example			Credential Tester
All Organizations Select the o	rganizations the credential belongs to " \neg	Timeout (ms) 30000	Select Credential Test
Hostname/IP*	Port*		Select Collector CUG RNG-ISO-B-CU: 10.2.10.16
%D	8443		
Username axluser	Password		IP or Hostname to test*
axiusei			Test Cri

- 4. Supply values in the following fields:
 - Name. Type a new name for the credential.
 - All Organizations. Toggle on (blue) to align the credential to all organizations, or toggle off (gray) and then select one or more specific organizations from the What organization manages this service? drop-down field to align the credential with those specific organizations.
 - Timeout (ms). Type the timeout value of each request, in milliseconds. The default value is "30000".

- Hostname/IP. Type the hostname or IP address, or you can type the variable "%D".
- **Port**. Type the port number.

NOTE: The example credential included in older versions of the Cisco: CUCM Unified Communications Manager PowerPack used "80" as the default **Port** number. If your Cisco Unified CM credential specifies port 80, SL1 will automatically override that value and use port 8443 instead. If your Cisco Unified CM credential specifies any port other than 80, SL1 will use that specified port.

- Username. Type the username for the Cisco Unified CM user account that you created to access the AXL web service. For details, see the Configuring a Cisco Unified CM User Account section.
- **Password**. Type the password for the username you entered in the **Username** field.
- 4. Click [Save & Close].

NOTE: If you would like to test your credential using the Credential Tester panel, click **[Save & Test]**. For detailed instructions on using the Credential Tester, see the **Testing the CUCM Credential** section.

Creating a CUCM Credential in the SL1 Classic User Interface

To use the Dynamic Applications in the Cisco: CUCM Unified Communications Manager PowerPack, you must first define a Basic/Snippet Cisco Unified CM credential in SL1. This credential allows SL1 to communicate with the Cisco Unified CM cluster. The Cisco: CUCM Unified Communications Manager PowerPack includes a template you can use to create this Basic/Snippet credential.

To modify the Cisco Unified CM Basic/Snippet Credential template for use with your Cisco Unified CM cluster:

- 1. Go to the **Credential Management** page (System > Manage > Credentials).
- 2. Click the wrench icon (*P*) for the Cisco CUCM Example credential. The **Credential Editor** modal window appears:

Credential Editor [84]		×
Edit Basic/Snippet Credential #84	New	Reset
Basic Settings		
Credential Name		
Cisco CUCM Example]
Hostname/IP Port	Timeout(ms)	
%D 8443 30000		
Username	Password	
axluser		
Save Save As		

- 3. Supply values in the following fields:
 - Credential Name. Type a new name for the credential.
 - Hostname/IP. Type the hostname or IP address, or you can type the variable "%D".
 - **Port**. Type the port number.

NOTE: The example credential included in older versions of the Cisco: CUCM Unified Communications Manager PowerPack used "80" as the default **Port** number. If your Cisco Unified CM credential specifies port 80, SL1 will automatically override that value and use port 8443 instead. If your Cisco Unified CM credential specifies any port other than 80, SL1 will use that specified port.

- Timeout (ms). Type the timeout value of each request, in milliseconds. The default value is "30000".
- Username. Type the username for the Cisco Unified CM user account that you created to access the AXL web service. For details, see the Configuring a Cisco Unified CM User Account section.
- Password. Type the password for the username you entered in the Username field.
- 4. Click the **[Save As]** button.

NOTE: If you are monitoring Cisco Unified CM license information with the Cisco Prime License Manager (PLM) and your PLM administrator username and password are the same as the user account you created to access the AXL web service, then you can use the same credential to access PLM. However, if your PLM administrator user information is different, then repeat these steps to create a credential to access PLM.

NOTE: If SNMP is enabled on the Cisco Unified CM cluster, then you can also create an optional SNMP credential that will be used only during discovery to classify the cluster device class. If SNMP is not available on the Cisco Unified CM cluster, then you **do not** need an SNMP credential. For more information on SNMP credentials, see the **Discovery and Credentials** manual.

Testing the CUCM Credential

SL1 includes a Credential Test for Cisco Unified CM. Credential Tests define a series of steps that SL1 can execute on demand to validate whether a credential works as expected.

The CUCM Credential Test can be used to test a Basic/Snippet credential for monitoring Cisco Unified CM using the Dynamic Applications in the Cisco: CUCM Unified Communications Manager PowerPack. The CUCM Credential Test performs the following steps:

- Test Reachability. Performs an ICMP ping request to see if the device is reachable.
- Test Name Resolution. Checks to see if nslookup can resolve the IP address or hostname.

- Test Port Availability. Performs an NMAP request to see if the appropriate port is open.
- Test Accessibility to Publisher. Checks to see if the common API service URLs on the publisher device can be queried.
- Test Accessibility to Subscribers via Publisher. Checks to see if data on a CUCM subscriber can be queried via the publisher.
- Test Accessibility to All Subscribers. Checks to see if the status of services on a CUCM subscriber can be queried.

To test the CUCM credential:

- 1. Go to the **Credential Test Management** page (System > Customize > Credential Tests).
- 2. Locate the **CUCM Credential Test** and click its lightning bolt icon (*I*). The **Credential Tester** modal page appears:

Credential Tester [BETA]	×
Test Type	[CUCM Credential Test]	
Credential	Cisco 10.0.13.20 V	
Hostname/IP		
Collector	RNG-MIG-C-CU7 V	
	Run Test	

- 3. Supply values in the following fields:
 - Test Type. This field is pre-populated with the credential test you selected.
 - **Credential**. Select the credential to test. This drop-down list includes only credentials that you have access to that can be tested using the selected credential test.
 - Hostname/IP. Enter the IP address or hostname for the device.

NOTE: The credential being tested cannot include more than 32 characters in the Hostname/IP field.

- Collector. Select the All-In-One Appliance or Data Collector that will run the test.
- 4. Click the **[Run Test]** button to run the credential test. The **Test Credential** window appears:

est Credential Test execution complete			
Step	Description	Log Message	Status
1 Test Reachability	Check to see if the device is reachable using ICMP	The device is reachable using ICMP. The average response time is 2.662ms	Passed
2 Test Name Resolution	Check to see if nslookup can resolve the IP and hostname	Name resolution succeeded: Reverse returned 1 result, Forward returned 1 result	Passed
3 Test Port Availability	Check to see if the appropriate port is open	Port 8443 is open	Passed
4 Test Accessibility to Publisher	Check to see if common API service URLs on the publisher device can be queried.	CUCM API resource requests succeeded	Passed
5 Test Accessibility to Subscribers via Publisher	Check to see if data on a CUCM subscriber can be queried via the publisher.	CUCM subscriber query through the publisher succeeded	Passed
6 Test Accessibility to All Subscribers	Check to see if the status of services on a CUCM subscriber can be queried.	CUCM subscriber is accessible with this credential	Passed

The **Test Credential** window displays a log entry for each step in the credential test. The steps performed are different for each credential test. The log entry for each step includes the following information:

- **Step**. The name of the step.
- **Description**. A description of the action performed during the step.
- Log Message. The result of the step for this credential test.
- **Status**. Whether the result of this step indicates the credential or the network environment is configured correctly (Passed) or incorrectly (Failed).
- Step Tip. Mouse over the question mark icon (C2) to display the tip text. The tip text recommends what to do to change the credential or the network environment if the step has a status of "Failed".

Manually Creating Host File Entries for CUCM Nodes

During the discovery process, SL1 automatically aligns the IP addresses and hostnames for each CallManager server (node) in a Cisco Unified CM cluster via DNS.

If you do not have access to DNS for the Cisco Unified CM system you want to monitor, you must manually create host file entries in SL1 for each node in the Cisco Unified CM cluster. Each host file entry must contain the IP address and hostname of a node in the Cisco Unified CM cluster.

NOTE: If you have access to DNS for the Cisco Unified CM system you want to monitor with SL1, you do not need to perform the steps to manually configure host file entries. Continue to the section on *Discovering a Cisco Unified CM Cluster*.

Repeat the following steps for each node in the Cisco Unified CM cluster.

To create a host file entry:

1. Go to the **Host File Entry Manager** page (System > Customize > Host Files).

Hostnames and Aliases	Description	Organization	CUG	Edited
HQ-PT-Dell1720n	Dell Printer			7admin 2015-10-29 19:47:1
HQ-W2K3-JUMP01	windows server	System C	CUG1 emi	7admin 2015-10-29 19:46:0
)[)(HQ-PT-Dell1720n Dell Printer		HQ-PFDell1720n Dell Printer System CUG1 em

2. Click the **[Action]** menu and choose **Create New Entry**. The **Create New Host File Entry** modal page appears.

Host File Entry Editor	×
Create New Host File Entry	Reset
IP Address	
Hostnames and Aliases	
Description	
Organization Collector	
[System] CUG1	
Save	

- 3. In the Create New Host File Entry modal page, supply values in the following fields:
 - *IP Address*. The IP address to resolve with the hostname.

NOTE: Server hostnames should be aligned to external IP addresses when supporting Network Address Translation (NAT) environments.

- Hostnames and Aliases. The hostname to align with the specified IP address. You can also include a space-delimited list of aliases for the host name.
- **Description**. Description of the host entry. This field is not written to the host file. This field is for administrators to use when managing host file entries.
- **Organization**. Organization associated with the host. You can select from a list of all existing organizations. This field is not written to the host file. This field is for administrators to use when managing host file entries. For example, a service provider could assign each customer its own organization and then use this field to manage host file entries for each customer.
- 4. Click the **[Save]** button to save the new host entry.

Chapter

Discovery

Overview

The following sections describe how to discover Cisco Unified Communications Manager (CUCM) clusters in SL1 using the Cisco: CUCM Unified Communications Manager PowerPack:

Discovering a CUCM Cluster	
Discovering a CUCM Cluster in the SL1 Classic User Interface	
Verifying Discovery and Dynamic Application Alignment	
Manually Aligning Dynamic Applications	34
Viewing Component Devices	

Discovering a CUCM Cluster

When you use the Cisco: CUCM Unified Communications Manager PowerPack to discover Cisco Unified CM devices, SL1 creates a device representing your Cisco Unified CM cluster. This cluster device acts as the root device for the remaining servers and component devices in your Cisco Unified CM system.

To create and run a discovery session that will discover a Cisco Unified CM cluster:

On the Devices page (I) or the Discovery Sessions page (Devices > Discovery Sessions), click the [Add Devices] button. The Select page appears:

Select the type of devices you want to monitor		×
	Ceneral Information Seteration of devices or services you want to monitor. Seteration of devices of services you add other devices that use core credentials, such as SMMP. Database. SOAPYAML Basic/Soippet. SSH/Rey, or PowerShell.	
Other ways to add devices: Unguided Network Discovery		

- 2. Click the **[Unguided Network Discovery]** button. Additional information about the requirements for discovery appears in the **General Information** pane to the right.
- 3. Click [Select]. The Add Devices page appears.
- 4. Complete the following fields:
 - **Name**. Type a unique name for this discovery session. This name is displayed in the list of discovery sessions on the **[Discovery Sessions]** tab.
 - **Description**. Optional. Type a short description of the discovery session. You can use the text in this description to search for the discovery session on the **[Discovery Sessions]** tab.
 - Select the organization to add discovered devices to. Select the name of the organization to which you want to add the discovered devices
- 5. Click [Next]. The Credentials page of the Add Devices wizard appears:

Step 1 Basic Infor	mation	2 Step 2 Credential Selection	3 Step 3 Discovery Session Details

Azure Credential Example	SOAP/XML	120000	Nov 15, 2021, 3:14 PM			
Back				Next		

- 6. On the **Credentials** page:
 - Select an SNMP credential to use with the Cisco Unified CM cluster. (For more information on SNMP credentials, see the **Discovery and Credentials** manual.).

NOTE: An SNMP credential is needed only to properly classify the devices in the cluster. If SNMP is not available on the Cisco Unified CM cluster, then you do not need to select an SNMP credential; in that scenario, the root device will be discovered as a pingable device and you must manually change it to a Cisco Unified CM cluster.

- Select the Cisco Cisco Unified CM Example credential that you edited in the section on Creating a Cisco Unified CM Credential..
- 7. Click [Next]. The Discovery Session Details page of the Add Devices wizard appears:

Step 1 Basic Information		Step 2 Credential Selection	3	Step 3 Discovery Session Details	×
	En	ter basic discovery session details			
	List of IPs/Hostnames		File Upload		
	1 10.0.0.55				
	Which collector will discover these devices? CUG em7aio17: 10.64.68.17		~	\$	
	Run after save				
	Advanced Options 🗸				
< Back				Save	And Run

- 8. Complete the following fields:
 - List of IPs/Hostnames. Type the IP addresses for the Cisco Unified CM Publishers.
 - Which collector will monitor these devices?. Required. Select an existing collector to monitor the discovered devices.
 - Run after save. Select this option to run this discovery session as soon as you save the session.
- 9. Click **[Save and Run]** if you enabled the Run after save setting, or **[Save and Close]** to save the discovery session. The **Discovery Sessions** page (Devices > Discovery Sessions) displays the new discovery session.
- 10. If you selected the **Run after save** option on this page, the discovery session runs, and the **Discovery Logs** page displays any relevant log messages. If the discovery session locates and adds any devices, the **Discovery Logs** page includes a link to the **Device Investigator** page for the discovered device.

NOTE: If you attempt to discover a CUCM cluster whose servers have been cloned from a separate CUCM cluster that has also been discovered within the same SL1 stack, the "Cisco: CUCM Subscriber Merge" Dynamic Application may incorrectly attempt to merge subscriber devices with components in another DCM tree. To avoid this, you must manually merge the subscriber server devices with their associated component devices in the correct cluster. The physical device of the CUCM Publisher should **not** be merged with its associated component device.

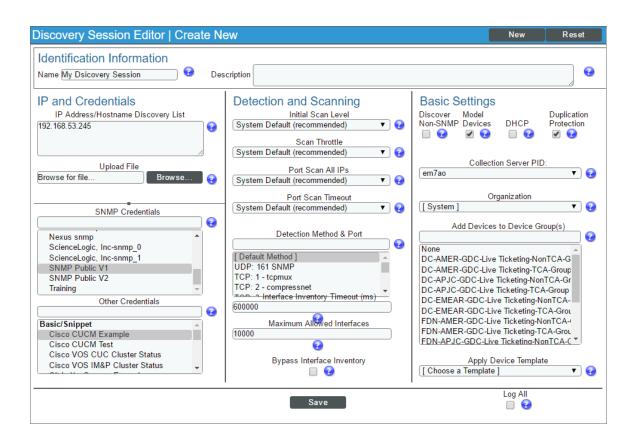

Discovering a CUCM Cluster in the SL1 Classic User Interface

When you use the Cisco: CUCM Unified Communications Manager PowerPack to discover Cisco Unified CM devices, SL1 creates a device representing your Cisco Unified CM cluster. This cluster device acts as the root device for the remaining servers and component devices in your Cisco Unified CM system.

To create and run a discovery session that will discover a Cisco Unified CM cluster:

1. Go to the **Discovery Control Panel** page (System > Manage > Classic Discovery).

2. Click the **[Create]** button to create a new discovery session. The **Discovery Session Editor** window appears:

- 3. Enter values in the following fields:
 - IP Address/Hostname Discovery List. Type the IP addresses for the Cisco Unified CM Publishers.

NOTE: To monitor Cisco Unified CM servers that are registered by name within their clusters, you might need to go to the **Host File Entry Manager** page (System > Customize > Host Files) and map the server names to their IP addresses if you do not have access to DNS for the Cisco Unified CM system you want to monitor. For Network Address Translation (NAT) environments, server hostnames should be mapped to external IP addresses. For more information, see the section *Manually Creating Host File Entries for Cisco Unified CM Nodes*.

• **SNMP Credential**. Select an SNMP credential to use with the Cisco Unified CM cluster. (For more information on SNMP credentials, see the **Discovery and Credentials** manual.)

NOTE: An SNMP credential is needed only to properly classify the devices in the cluster. If SNMP is not available on the Cisco Unified CM cluster, then you do not need to select an SNMP credential; in that scenario, the root device will be discovered as a pingable device and you must manually change it to a Cisco Unified CM cluster.

- Other Credentials. Select the Cisco Cisco Unified CM Example credential that you edited in the section on Creating a Cisco Unified CM Credential.
- You can enter values in the other fields on this page, but are not required to and can simply accept the default values. For more information about the other fields on this page, see the *Discovery and Credentials* manual.
- 5. Click [Save] and then close the Discovery Session Editor window.
- 6. The discovery session you created appears at the top of the **Discovery Control Panel** page. Click its lightning bolt icon (*F*) to run the discovery session.
- 7. The **Discovery Session** window appears.
- 8. When the Cisco Unified CM cluster is discovered, click its device icon () to view the **Device Properties** page for the Cisco Unified CM cluster.

NOTE: If you attempt to discover a CUCM cluster whose servers have been cloned from a separate CUCM cluster that has also been discovered within the same SL1 stack, the "Cisco: CUCM Subscriber Merge" DA may incorrectly attempt to merge subscriber devices with components in another DCM tree. To avoid this, you must manually merge the subscriber server devices with their associated component devices in the correct cluster. The physical device of the CUCM Publisher should **not** be merged with its associated component device.

Verifying Discovery and Dynamic Application Alignment

The Dynamic Applications for monitoring Cisco Unified CM are aligned during discovery.

To verify that SL1 has automatically aligned the correct Dynamic Applications:

1. In the **Devices** page, locate the newly discovered Cisco Unified CM cluster and click on it to view the **Device Investigator** page.

2. From the **Device Investigator** page for the Cisco Unified CM cluster, click the **[Collections]** tab. The **Dynamic Application Collections** page appears.

- Cisco: CUCM Subscriber Merge

Manually Aligning Dynamic Applications

If the Dynamic Applications have not been automatically aligned, you can align them manually.

To manually align Dynamic Applications:

- From the **Device Manager** page (Devices > Device Manager), find the Cisco Unified CM cluster and click its wrench icon (^J).
- 2. From the **Device Properties** page for the Cisco Unified CM cluster, click the **[Collections]** tab.
- 2. Click the **[Actions]** button and then click Add Dynamic Applications. The **Dynamic Application Alignment** page appears:

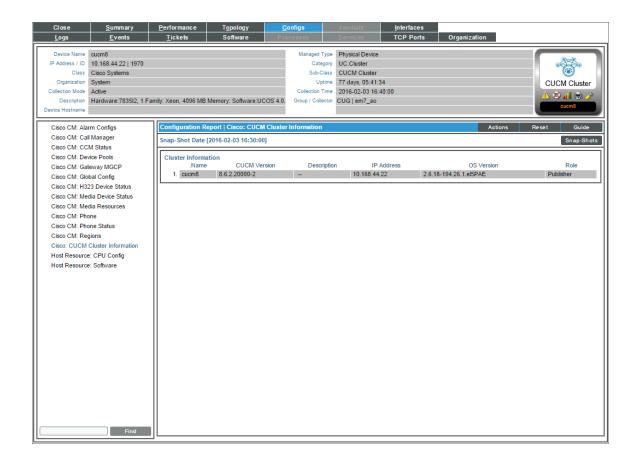

- 3. In the *Dynamic Applications* field, select the Dynamic Application you want to align.
- 4. In the **Credentials** field, select the SNMP credential you created for monitor the Cisco Unified CM cluster.
- 5. Repeat steps 2-4 for the remaining Dynamic Applications to align with the device.

6. After aligning the Dynamic Applications, click the **[Reset]** button and then click the plus icon (+) for the

Dynamic Application. If collection for the Dynamic Application was successful, the graph icons (11) for the Dynamic Application are enabled:

7. Click a graph icon (¹¹¹) to view the collected data. The **Configuration Report** page will display the number of components of each type and the total number of components managed by the Cisco Unified CM cluster:

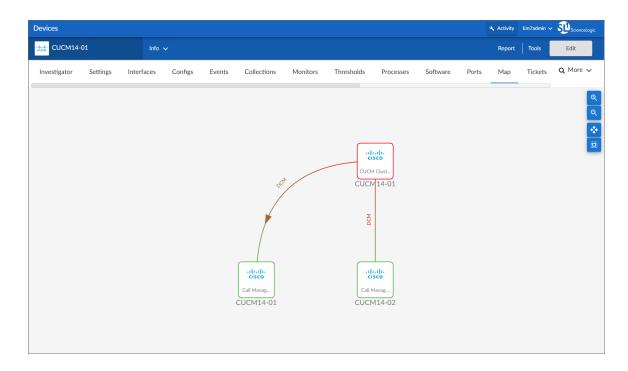

Viewing Component Devices

When SL1 performs collection for a Cisco Unified CM cluster, SL1 will create component devices for the components in the Cisco Unified CM cluster and align other Dynamic Applications to those component devices. Some of the Dynamic Applications aligned to the component devices will also be used to create additional component devices. All component devices appear in the **Device Manager** page just like devices discovered using the ScienceLogic discovery process.

In addition to the **Devices** page, you can view the Cisco Unified CM cluster and all associated component devices in the following places in the user interface

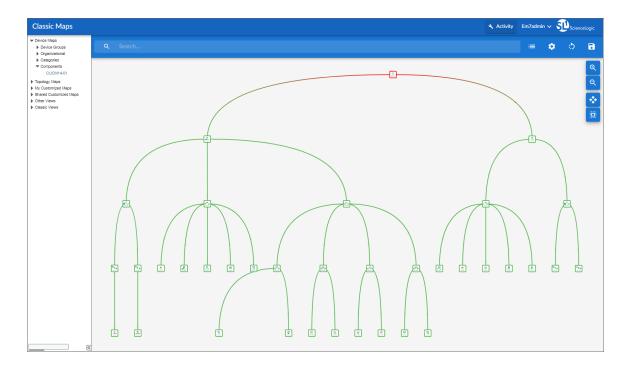

• The **Device Investigator** Map page (click **Map** in the **Device Investigator** page) displays a map of a particular device and all of the devices with which it has parent-child relationships. Double-clicking any of the listed devices reloads the page to make the selected device the primary device.

 The Device Components page (Devices > Device Components) displays a list of all root devices and component devices discovered by SL1. The Device Components page displays all root devices and component devices in an indented view, so you can easily view the hierarchy and relationships between child devices, parent devices, and root devices. To view the component devices associated with a Cisco Unified CM cluster, find the Cisco Unified CM cluster and select its plus icon (+).

The Component Map page (Classic Maps > Device Maps > Components) allows you to view devices by
root node and view the relationships between root nodes, parent components, and child components in a
map. This makes it easy to visualize and manage root nodes and their components. SL1 automatically
updates the Component Map as new component devices are discovered. The platform also updates each
map with the latest status and event information. To view the map for a Cisco Unified CM cluster, go to the
Component Map page and select the map from the list in the left NavBar. To learn more about the
Component Map page, see the Maps manual.

Dashboards in the SL1 Classic User Interface

Overview

The Cisco: CUCM Unified Communications Manager PowerPack comes paired with the Cisco: CUCM Dashboards PowerPack, which contains dashboards that present data related to different aspects of Cisco Unified CM clusters.

NOTE: These dashboards appear only in the SL1 classic user interface.

The following sections describe how to install the Cisco: CUCM Dashboards PowerPack and provide a description of each dashboard:

Installing the CUCM Dashboards	40
Cisco: CUCM Performance Dashboard	40
Cisco: CUCM Locations LBM	. 41
Cisco: CUCM Media Resources	42
Cisco: CUCM Media Resources (Simple)	43
Cisco: CUCM Tomcat	. 44
Cisco: CUCM Overall Cluster Health	45
Cisco: CUCM Active Calls	46

Installing the CUCM Dashboards

To view the Cisco Unified CM dashboards in SL1, you must install the Cisco: CUCM Dashboards PowerPack. To do so:

- 1. Go to the **PowerPack Manager** page (System > Manage > PowerPacks).
- 2. Click the [Actions] button, then select Install PowerPack. The Imported PowerPacks modal page appears.
- Use the search filter in the *PowerPack Name* column heading to locate the PowerPack you want to install. To do so, enter text to match, including special characters, and the *Imported PowerPacks* modal page displays only PowerPacks that have a matching name.

The dashboard includes the following widgets:

- Top 25: CPU (Average, All devices, Last 12 Hours). This widget displays a bar graph that depicts the 25 Cisco CallManager devices that used the highest percentage of CPU time over the last 12 hours.
- **Top Processes By Utilization**. This widget displays a bar graph that depicts all Cisco Unified CM processes in the cluster, ordered by utilization from highest to lowest.
- **CUCM Vitals**. This widget displays a line graph that depicts the cluster's vitals by percent, including CPU time, Swap Utilization, and Memory Utilization, over time.
- **Read and Write Operations Per Second**. This widget displays a line graph that depicts read and write requests per second over time.
- Average IO Wait Time. This widget displays a line graph that depicts the average IO wait time over time.
- SIP Signaling Performance. This widget displays a line graph that depicts SIP signaling performance over time.
- SIP Stack Performance. This widget displays a line graph that depicts SIP stack performance over time.
- **Signaling Performance**. This widget displays a line graph that depicts overall signaling performance over time.
- **System Performance**. This widget displays a line graph that depicts multiple system performance metrics over time.
- SIP Station Performance. This widget displays a line graph that depicts multiple SIP station performance metrics over time.
- TCP Performance. This widget displays a line graph that depicts TCP performance over time.

Cisco: CUCM Locations LBM

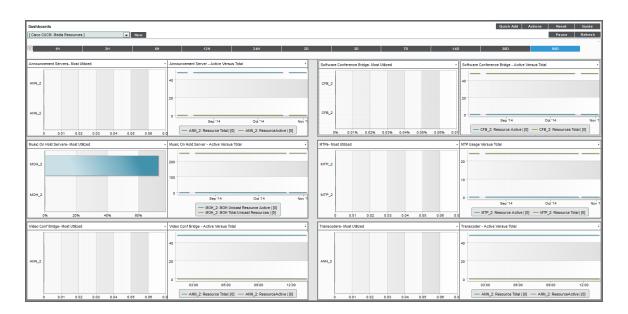

The Cisco: CUCM Locations LBM (Location Bandwidth Manager) dashboard displays eight widgets.

The dashboard includes the following widgets:

- **Top Locations by Audio Bandwidth**. This widget displays a horizontal bar graph that depicts a list of locations, ordered by audio bandwidth usage by percent, from highest to lowest.
- Location Audio Bandwidth Utilization. This widget displays a line graph that depicts audio bandwidth utilization over time.
- Top Locations by Available Bandwidth. This widget displays a horizontal bar graph that depicts a list of locations, ordered by available bandwidth in kpbs, from highest to lowest.
- Location Available Bandwidth. This widget displays a line graph that depicts available bandwidth over time.
- **Top Locations by Video Bandwidth**. This widget displays a line graph that a list of locations, ordered by video bandwidth by percent, from highest to lowest.
- Location Video Bandwidth Utilization. This widget displays a line graph that depicts video bandwidth utilization over time.
- Top Locations by Telepresence Bandwidth Utilization. This widget displays a horizontal bar graph that depicts a list of locations, ordered by TelePresence bandwidth usage in percent, from highest to lowest.
- Location Telepresence BW Utilization. This widget displays a line graph that depicts TelePresence bandwidth utilization over time.

Cisco: CUCM Media Resources

The Cisco: CUCM Media Resources dashboard displays 12 widgets that display the most utilized and active versus total metrics for transcoding, announcement servers, streaming music to callers on hold, video, conferencing, and media termination points.

The dashboard includes the following widgets:

- Announcement Servers Most Utilized. This widget displays a horizontal bar graph that depicts the most utilized announcement servers.
- Announcement Server Active Versus Total. This widget displays a line graph that depicts the active announcement servers versus the total announcement servers over time.
- Software Conference Bridge Most Utilized. This widget displays a horizontal bar graph that depicts the most utilized software conference bridges by percent.
- Software Conference Bridge Active Versus Total. This widget displays a line graph that depicts the active versus total software conference bridges over time.
- Music On Hold Servers Most Utilized. This widget displays a horizontal bar graph that depicts the most utilized music-on-hold servers by percent.
- Music On Hold Servers Active Versus Total. This widget displays a line graph that depicts the active versus total music-on-hold servers over time.
- MTPs Most Utilized. This widget displays a horizontal bar graph that depicts the most utilized Media Transfer Protocols (MTPs) by percent.
- **MTP Usage Versus Total**. This widget displays a line graph that depicts the usage versus total Media Transfer Protocols (MTPs) over time.
- Video Conf Bridge Most Utilized. This widget displays a horizontal bar graph that depicts the most utilized video conference bridges by percent.
- Video Conf Bridge Active Versus Total. This widget displays a line graph that depicts the active versus total video conference bridges over time.
- **Transcoders Most Utilized**. This widget displays a horizontal bar graph that depicts the most utilized transcoders by percent.
- **Transcoders Active Versus Total**. This widget displays a line graph that depicts the active versus total transcoders over time.

Cisco: CUCM Media Resources (Simple)

The Cisco: CUCM Media Resources dashboard displays eight widgets which display the most utilized and active versus total metrics for announcement servers, streaming music to callers on hold, conferencing, and media termination points.

The dashboard includes the following widgets:

- Top SIP Trunks by Number of Active Calls. This widget displays a horizontal bar graph that depicts the most utilized SIP trunks.
- SIP Trunk Active Calls (Per Trunk). This widget displays a line graph that depicts the number of active calls per SIP Trunk over time.
- Software Conference Bridge Most Utilized. This widget displays a horizontal bar graph that depicts the most utilized software conference bridges by percent.
- Software Conference Bridge Active Versus Total. This widget displays a line graph that depicts the active versus total software conference bridges over time.
- Music On Hold Servers Most Utilized. This widget displays a horizontal bar graph that depicts the most utilized music-on-hold servers by percent.
- Music On Hold Servers Active Versus Total. This widget displays a line graph that depicts the active versus total music-on-hold servers over time.
- **MTPs Most Utilized**. This widget displays a horizontal bar graph that depicts the most utilized Media Transfer Protocols (MTPs) by percent.
- **MTP Usage Versus Total**. This widget displays a line graph that depicts the usage versus total Media Transfer Protocols (MTPs) over time.

Cisco: CUCM Tomcat

The Cisco: CUCM Tomcat dashboard displays 12 widgets that monitor servers and services that use the Tomcat Java Webserver.

The dashboard includes the following widgets:

- Tomcat Top Servers by Number of Requests. This widget displays a horizontal bar graph that depicts the servers with the highest number of requests.
- Tomcat % Memory Utilization. This widget displays a line graph that depicts the percentage of memory utilization over time.
- Tomcat % Total Errors. This widget displays a line graph that depicts the percentage of errors over time.
- Tomcat Connector Total Sessions Active. This widget displays a line graph that depicts the total active Tomcat Connector sessions over time.
- Tomcat Top 10 Services By Number of Requests. This widget displays a horizontal bar graph that depicts the ten services with the most requests.
- Tomcat Number of Requests (Per Service). This widget displays a line graph that depicts the number of requests per service over time.
- Tomcat Top 10 Services by Errors. This widget displays a horizontal bar graph that depicts the ten services with the most errors.
- Tomcat Errors (Per Service). This widget displays a line graph that depicts errors per service over time.
- Tomcat Top 5 Services by Sessions Active. This widget displays a horizontal bar graph that depicts the five services with the most active sessions.
- Tomcat Sessions Active. This widget displays a line graph that depicts active Tomcat sessions over time.
- Tomcat Top Connectors By Errors/Threads Busy. This widget displays a horizontal bar graph that depicts the Connectors with the most errors and busy threads.
- Tomcat Connector Errors or Threads Busy (Per Connector). This widget displays a line graph that depicts connector errors or busy threads per connector over time.

Cisco: CUCM Overall Cluster Health

The Cisco: CUCM Overall Cluster Health dashboard contains nine widgets that monitor aspects of the cluster's overall health.

The dashboard includes the following widgets:

- Eight gauge widgets use IT Service Monitor Policies to display the following:
 - ° Cluster Health
 - ° Trunk Health
 - ° Gateway Health
 - ° Media Resources Health
 - Cluster Call Completions
 - CUCM Server Health
 - TFTP Health
 - ° Tomcat Health
- At the bottom of the dashboard, a line graph depicts the overall cluster health by percentage over time.

Cisco: CUCM Active Calls

The Cisco: CUCM Active Calls widget displays 12 graphs that monitor active calls, conferences, and active channels.

The widgets display:

- Top 10 Call Managers By Active Calls. This widget displays a horizontal bar graph that depicts the ten call managers with the highest number of active calls.
- Total Active Calls (By CUCM). This widget displays a line graph that depicts total active calls by CUCM over time.
- Media Resources Active MOH, SW and HW Conferences. This widget displays a line graph that depicts active MOH, SW, and HW conference media resources over time.
- Media Resources Active VCB, XCoders, MCU Conferences. This widget displays a line graph that depicts active VCB, XCoders, and MCU conferences over time.
- **PRI and T1 Active Channels**. This widget displays a line graph that depicts the active PRI and T1 channels over time.
- FXS, FXO, and BRI Active Calls. This widget displays a line graph that depicts FXS, FXO, and BRI active calls over time.
- Video Calls Active. This widget displays a line graph that depicts active video calls over time.
- Top 10 Hunt Lists By Active Calls. This widget displays a horizontal bar graph that depicts the ten hunt lists with the highest number of active calls.
- Top SIP Trunks By Number of Active Calls. This widget displays a horizontal bar graph that depicts the SIP trunks with the highest number of active calls.
- SIP Trunk Active Calls (Per Trunk). This widget displays a line graph that depicts active SIP trunk calls over time.
- Top H323 Trunks By Number of Active Calls. This widget displays a horizontal bar graph that depicts the H323 trunks with the highest number of active calls.
- H323 Trunk Active Calls (Per Trunk). This widget displays a line graph that depicts active H323 trunk calls over time.

Troubleshooting

Overview

The following sections describe resolutions to some issues you might encounter when monitoring Cisco Unified Communications Manager:

Resolving Network Connectivity Issues	48
Resolving Credential Issues	
Basic/Snippet (AXL User) Credentials	49
SNMP Credentials	50
Resolving NAT Issues	
Resolving Error Messages	50
Running Dynamic Applications in Debug Mode	51

Resolving Network Connectivity Issues

If you experience network connectivity issues, you can follow the steps in this section to diagnose the cause.

To diagnose network connectivity issues:

- 1. Use a Secure Shell (SSH) client software such as PuTTY to log in to the ScienceLogic Data Collector.
- 2. Type the following command:

```
ping <Cisco Unified CM Publisher IP>
```

If this fails, check to see if the network is blocking ICMP traffic anywhere, as this might identify a firewall that is not documented.

3. Type the following command:

nmap -sU -Pn -p 161 <Cisco Unified CM Publisher IP>

This will validate whether or not you have SNMP connectivity. If you do not, you might be on an access control list (ACL).

4. Type the following command:

nmap -sS -Pn -p 8443 <Cisco Unified CM Publisher IP>

This will determine if you have AXL connectivity.

5. Type the following command:

traceroute <Cisco Unified CM Publisher IP>

This will identify any additional unknown firewalls or unexpected routing paths.

If you cannot identify the causes of your network connectivity issues using these steps, you might be experiencing a DNS resolution issue. For more information, see the *Manually Creating Host File Entries for CUCM Nodes* section.

Resolving Credential Issues

Basic/Snippet (AXL User) Credentials

The following list includes commands that you can use to validate your Basic/Snippet Cisco Unified CM credentials:

• To validate that the credential can communicate with the AXL API service:

```
curl -k -u <USER>:<PASSWORD> -H "Content-type: text/xml;" https://<Cisco Unified CM Publisher IP>:8443/axl/services/AXLAPIService?wsdl
```

• To validate that the credential can communicate with the Real Time Information port:

```
curl -k -u <USER>:<PASSWORD> -H "Content-type: text/xml;" https://<Cisco Unified
CM Publisher IP>:8443/realtimeservice/services/RisPort?wsdl
```

• To validate that the credential can communicate with the Performance Monitor port:

```
curl -k -u <USER>:<PASSWORD> -H "Content-type: text/xml;" https://<Cisco Unified
CM Publisher IP>:8443/perfmonservice/services/PerfmonPort?wsdl
```

• To validate that the credential can communicate with the SOAP monitor service:

```
curl -k -u <USER>:<PASSWORD> -H "Content-type: text/xml;" https://<Cisco Unified
CM Publisher IP>:8443/realtimeservice/services/SOAPMonitorService?wsdl
```

• To validate that the credential can communicate with the Control Center service port:

curl -k -u <USER>:<PASSWORD> -H "Content-type: text/xml;" https://<Cisco Unified CM Publisher IP>:8443/controlcenterservice/services/ControlCenterServicesPort?wsdl

SNMP Credentials

You can use the following commands to validate your SNMP credentials:

• For SNMP v2:

snmpwalk -v 2c -c <read string> <Cisco Unified CM Publisher IP> system

• For SNMP v3:

```
snmpwalk -v3 -1 authNoPriv -u <username> -a SHA -A <password> <Cisco Unified
CM Publisher IP>
```

Resolving NAT Issues

NOTE: See the section **Configuring CUCM for NAT** for steps on enabling support for network address translation (NAT).

If a customer must have a firewall between the ScienceLogic Data Collector and the Cisco Unified CM Cluster, then check the firewall to determine if the firewall is performing network address translation (NAT).

If NAT is enabled:

- 1. The customer must provide a hostname and an IP address accessible from the Data Collector for the Cluster and each subscribing CallManager.
- Add the CallManager hostnames and IP addresses to host file entries. (For more information, see the Manually Creating Host File Entries for CUCM Nodes section.)
- 3. Allow time for the host file to be propagated to the Data Collector.

Resolving Error Messages

The following error message might be generated during collection for the Cisco Unified Communications Manager Dynamic Applications.

NOTE: You can also follow these instructions if the CallManager is defined by an IP address but not a hostname.

Error / Message	Cause / Resolution
When running the "Cisco: CUCM Cluster Root Cache" Dynamic Application, you receive an error message stating "[Application number, snippet number] reported a collection problem. (Explanation: The server is not specified as a Publisher.)"	SL1 cannot determine the node's IP address. You must add the node hostname and IP address to a host file. (For more information, see the <i>Manually Creating</i> <i>Host File Entries for CUCM Nodes</i> section.)

Running Dynamic Applications in Debug Mode

To identify issues with a specific Dynamic Application, go to the **Dynamic Application Collections** page (Registry > Devices > wrench icon > Collections) and run the Dynamic Application by clicking its lightning bolt icon (\checkmark). Doing so provides you with details about any issues the Dynamic Application might be experiencing with the provided URL, IP address, or credentials.

Another method, which will provide even more data, is to run the Dynamic Application in debug mode. To run a Dynamic Application in debug mode, type the following command from the command line interface for the Data Collector:

```
sudo -u s-em7-core SILO_DEBUG=1 /opt/em7/backend/dynamic_single.py <device ID>
<Dynamic Application ID>
```
