Chapter

1

Introduction

Overview

This chapter describes how to monitor a Cisco Unified Communications Manager (CM) system in Skylar One.

This chapter covers the following topics:

<i>What is Cisco Unified Communications Manager?</i>	5
<i>What Does the Cisco: CUCM Unified Communications Manager PowerPack Monitor?</i>	5
<i>Supported Versions</i>	5
<i>Installing the Cisco: CUCM Unified Communications Manager PowerPack</i>	6

NOTE: ScienceLogic provides this documentation for the convenience of ScienceLogic customers. Some of the configuration information contained herein pertains to third-party vendor software that is subject to change without notice to ScienceLogic. ScienceLogic makes every attempt to maintain accurate technical information and cannot be held responsible for defects or changes in third-party vendor software. There is no written or implied guarantee that information contained herein will work for all third-party variants. See the End User License Agreement (EULA) for more information.

What is Cisco Unified Communications Manager?

Cisco Unified Communications Manager, also known as CallManager, is a unified call control and communications platform that provides services such as session management, voice, video, messaging, mobility, and web conferencing. Multiple CallManager servers can be grouped together into a cluster, which enables the CallManagers to share resources and features for better system scalability.

What Does the Cisco: CUCM Unified Communications Manager PowerPack Monitor?

To monitor Cisco Unified CM using Skylar One, you must install the "Cisco: CUCM Unified Communications Manager" PowerPack. This PowerPack enables you to discover, model, and collect data about your Cisco Unified CM system and clusters.

The "Cisco: CUCM Unified Communications Manager" PowerPack includes:

- An example credential you can use as a template to create a Basic/Snippet credential to connect to the Cisco Unified CM clusters you want to monitor
- Dynamic Applications to discover, model, and monitor performance metrics and collect configuration data for Cisco Unified CM clusters
- Device classes for each of the Cisco Unified CM clusters that Skylar One monitors
- Event policies and corresponding alerts that are triggered when Cisco Unified CM clusters meet certain status criteria
- Dashboards that display graphical information about Cisco Unified CM clusters
- Run book actions and automation policies that assign the Cisco Unified CM cluster root device to the appropriate device class, merge subscriber and physical component devices, and clear any unregistration events for a device when the same device is registered on another node in the cluster

NOTE: The run book action that assigns the root device disables the Cisco Unified CM cluster root device's <i>Auto-Update</i> option.

Supported Versions

You can use this PowerPack to monitor versions 10.x, 11.x, 12.x and 14.x of Cisco Unified CM.

Installing the Cisco: CUCM Unified Communications Manager PowerPack

Before completing the steps in this manual, you must import and install the latest version of the "Cisco: CUCM Unified Communications Manager" PowerPack.

TIP: By default, installing a new version of a PowerPack overwrites all content from a previous version of that PowerPack that has already been installed on the target system. You can use the **Enable Selective PowerPack Field Protection** setting in the **Behavior Settings** page (System > Settings > Behavior) to prevent new PowerPacks from overwriting local changes for some commonly customized fields. For more information, see the section on [Global Settings](#).

NOTE: For details on upgrading Skylar One, see the relevant [Skylar One Platform Release Notes](#).

To download and install the PowerPack:

1. Search for and download the PowerPack from the **PowerPacks** page at the [ScienceLogic Support Center](#) (Skylar One > PowerPacks, login required).
2. In Skylar One, go to the **PowerPacks** page (System > Manage > PowerPacks).
3. Click the **[Actions]** button and choose *Import PowerPack*. The **Import PowerPack** dialog box appears.
4. Click **[Browse]** and navigate to the PowerPack file from step 1.
5. Select the PowerPack file and click **[Import]**. The **PowerPack Installer** modal displays a list of the PowerPack contents.
6. Click **[Install]**. The PowerPack is added to the **PowerPacks** page.

NOTE: If you exit the **PowerPack Installer** modal without installing the imported PowerPack, the imported PowerPack will not appear in the **PowerPacks** page. However, the imported PowerPack will appear in the **Imported PowerPacks** modal. This page appears when you click the **[Actions]** menu and select *Install PowerPack*.

Chapter

2

Configuration and Credentials

Overview

The following sections describe how to configure a Cisco Unified Communications Manager (CM) system for monitoring by Skylar One using the "Cisco: CUCM Unified Communications Manager" PowerPack.

This chapter covers the following topics:

<i>Prerequisites for Monitoring CUCM</i>	7
<i>Configuring Skylar One to Monitor CUCM</i>	8
<i>Enabling the CUCM AXL Web Service</i>	11
<i>Configuring a CUCM User Account</i>	12
<i>Configuring Prime License Manager</i>	13
<i>Creating a CUCM Credential</i>	14
<i>Manually Creating Host File Entries for CUCM Nodes</i>	16

Prerequisites for Monitoring CUCM

During the discovery process, Skylar One automatically aligns the IP addresses and hostnames for each node in a Cisco Unified CM cluster via DNS.

If you do not have access to DNS for the Cisco Unified CM systems that you want to monitor with Skylar One, ensure that you know or have access to the following information about each node:

- IP address
- Hostname

Configuring Skylar One to Monitor CUCM

You can choose from several different possible configurations when using Skylar One to monitor Cisco Unified CM:

- You can have the ScienceLogic Data Collector either in front of a firewall or behind a firewall.
- You can define the CallManager nodes either by hostname or by IP address in the Cisco Unified CM database.
- In some scenarios, you can also use network address translation (NAT) when defining the CallManagers.

These various methods are described in this section.

Method 1

In the first scenario, the Data Collector sits in front of the firewall and you define the CallManagers by hostname:

In this scenario, you must have the following ports open for the firewall:

Direction	Port	Protocol
ScienceLogic Database Server to the Data Collector	7707	TCP
PhoneHome Collector to the Database Server	7705	TCP

Method 2

In the second scenario, the Data Collector sits in front of the firewall and you define the CallManagers by IP address. This method requires you to [create a host file](#) that includes the CallManager hostname and IP address:

In this scenario, you must have the following ports open for the firewall:

Direction	Port	Protocol
ScienceLogic Database Server to the Data Collector	7707	TCP
PhoneHome Collector to the Database Server	7705	TCP

Method 3

In the third scenario, the Data Collector sits behind the firewall and you define the CallManagers by hostname:

In this scenario, you must have the following ports open for the firewall:

Direction	Credential	Port	Protocol
ScienceLogic Data Collector to the Cisco Unified CM Cluster and CallManagers	SNMP	161	UDP
	Cisco Unified CM user	8443	TCP

Method 4

In the fourth scenario, the Data Collector sits behind the firewall and you define the CallManagers by hostname, with NAT. This method requires you to [create a host file](#) that includes the CallManager hostname and the IP address the Data Collector can use to access the device:

In this scenario, you must have the following ports open for the firewall:

Direction	Credential	Port	Protocol
ScienceLogic Data Collector to the Cisco Unified CM Cluster and CallManagers	SNMP	161	UDP
	Cisco Unified CM user	8443	TCP

Method 5

In the final scenario, the Data Collector sits behind the firewall and you define the CallManagers by IP address, with NAT. This method requires you to [create a host file](#) that includes the CallManager host name and IP address the Data Collector can use to access the device:

NOTE: This method is not supported by versions of the "Cisco: CUCM Unified Communications Manager" PowerPack prior to version 109.

In this scenario, you must have the following ports open for the firewall:

Direction	Credential	Port	Protocol
ScienceLogic Data Collector to the Cisco Unified CM Cluster and CallManagers	SNMP	161	UDP
	Cisco Unified CM user	8443	TCP

Configuring CUCM for NAT

If you are using Network Address Translation (NAT) in your environment, you will need to adjust a threshold in the "Cisco: CUCM Cluster Information" Dynamic Application to enable NAT support.

To configure the threshold object:

1. Go to the **Dynamic Applications Manager** page (System > Manage > Dynamic Applications).
2. Locate the "Cisco: CUCM Cluster Information" Dynamic Application and click its wrench icon (🔧).
3. In the **Dynamic Applications Properties Editor**, click the **[Thresholds]** tab.
4. Click the wrench icon (🔧) for the "Use Server Hostname for NAT" threshold object.
5. Ensure that the **Override Threshold Value** field is set to *Enabled*.
6. In the **Threshold Value** field, type "1".

NOTE: The **Threshold Value** will be reset when you upgrade the PowerPack if you have not enabled the **Enable Selective PowerPack Field Protection** setting. To do this, go to the **Behavior Settings** page (System > Settings > Behavior) and click the **Enable Selective PowerPack Field Protection** checkbox.

7. Click **[Save]**.

Enabling the CUCM AXL Web Service

Skylar One can monitor a Cisco Unified CM system by requesting detailed information about the system from the Cisco Unified CM AXL Web Service.

The Cisco Unified CM AXL web service is disabled by default. To enable the AXL web service, perform the following steps:

1. In a browser window, navigate to the following address:

```
https://ip-address-of-CM-system:8443/ccmadmin/showHome.do
```

2. Log in to the Cisco Unified CM Administration site as an administrator.
3. In the **Navigation** drop-down list at the top-right corner of the page, select *Cisco Unified Serviceability*, and then click the **[Go]** button. The **Cisco Unified Serviceability** page appears.

4. In the navigation bar at the top-left of the page, hover over **Tools**, then select **Service Activation**. The **Service Activation** page appears.
5. In the **Server** drop-down list, select the Cisco Unified CM server for which you want to enable the AXL web service, and then click the **[Go]** button.
6. In the list of services, locate the **Database and Admin Services** section. If the *Activation Status* of the **Cisco AXL Web Service** is "Activated", the AXL web service is already enabled.
7. If the *Activation Status* of the **Cisco AXL Web Service** is not "Activated", select the checkbox for the **Cisco AXL Web Service**.
8. Click the **[Save]** button at the bottom of the page to save your changes, and then click the **[OK]** button in the pop-up window that appears.

Configuring a CUCM User Account

ScienceLogic recommends that you create a Cisco Unified CM user account that will be used only by Skylar One to access the AXL web service. To create a user account in Cisco Unified CM that can access only the AXL web service, perform these two steps:

- Create a user account.
- Create a user group that includes the user account and has permission to access only the AXL web service.

To create a new Cisco Unified CM user group and user account, perform the following steps:

1. In a browser window, navigate to the following address:

```
https://ip-address-of-CM-system:8443/ccmadmin/showHome.do
```

2. Log in to the Cisco Unified CM Administration site as an administrator.
3. In the navigation bar at the top-left of the page, hover over **User Management**, then select **Application User**. The **Find and List Users** page appears.
4. Click the **[+ Add New]** button. The **Application User Configuration** page appears.
5. Supply values in the following fields:
 - **User ID**. Type a username for the new user.
 - **Password**. Type a password for the new user.
 - **Confirm Password**. Type the password for the new user again.
6. Click the **[Save]** button.
7. In the navigation bar at the top-left of the page, hover over **User Management**, then select **User Group**. The **Find and List User Groups** page appears.
8. Click the **[+ Add New]** button. The **User Group Configuration** page appears.
9. In the **Name** field, type a name for the user group. For example, you could call the user group "AXL Access".
10. Click the **[Save]** button.
11. Click the **[Add App Users to Group]** button. The **Find and List Application Users** window appears.

12. Click the **[Find]** button. In the list of users, select the checkbox for the user account that you created, then click the **[Add Selected]** button at the bottom of the page.
13. The **Find and List Application Users** window closes. In the **User Group Configuration** page, the user account is included in the list of users
14. In the **Related Links** drop-down list at the top-right hand corner of the page, select *Assign Role to User Group*, and then click the **[Go]** button. The **User Group Configuration** page appears.
15. Click the **[Assign Role to Group]** button. The **Find and List Roles** window appears.
16. Click the **[Find]** button. A list of roles appears.
17. Select the checkboxes for the following roles:
 - *Standard AXL API Access*
 - *Standard CCM Admin Users*
 - *Standard SERVICEABILITY Read Only*
18. Click the **[Add Selected]** button at the bottom of the page.
19. The **Find and List Roles** window closes. In the **User Group Configuration** page, the **Roles** field includes the *Standard AXL API Access* role.
20. Click the **[Save]** button.

Configuring Prime License Manager

If you want to monitor Cisco Unified CM license information from Cisco Prime License Manager (PLM), you must create an administrator user account that Skylar One can use to access PLM.

To create an administrator user in PLM:

1. In a browser window, navigate to the following address:

`https://ip-address-of-plm-server/elm-admin/`
2. Log in to the Cisco PLM site as an administrator.
3. In the **Administration** drop-down menu, select *Administrator Accounts*.
4. Click the **[Add Administrator]** button.
5. In the **Add Administrator Account** modal page, make entries in the following fields.
 - **Name/Description**. Type a name or description for the account.
 - **Username**. Type the account username.
 - **Password**. Type the account password.
 - **Re-enter Password**. Type the account password again.
6. Click **[OK]**.

Creating a CUCM Credential

To use the Dynamic Applications in the "Cisco: CUCM Unified Communications Manager" PowerPack, you must first define a Basic/Snippet Cisco Unified CM credential in Skylar One. This credential allows Skylar One to communicate with the Cisco Unified CM cluster. The "Cisco: CUCM Unified Communications Manager" PowerPack includes a template you can use to create this Basic/Snippet credential.

NOTE: If you are using a Skylar One system prior to version 11.1.0, the new user interface does not include the **Duplicate** option for sample credential(s). ScienceLogic recommends that you use [the classic user interface and the Save As button](#) to create new credentials from sample credentials. This will prevent you from overwriting the sample credential(s).

To modify the Cisco Unified CM Basic/Snippet Credential template for use with your Cisco Unified CM cluster:

1. Go to the **Credentials** page (Manage > Credentials).
2. Locate the "Cisco CUCM Example" sample credential. Click its **[Actions]** icon () and select **Duplicate**. A copy of the credential, called **Cisco CUCM Example copy** appears.
3. Click the **[Actions]** icon () for the **Cisco CUCM Example copy** credential and select **Edit**. The **Edit Credential** page appears:

The screenshot shows the "Edit Credential" dialog box. It has a title bar "Edit Credential" with a close button (X). The dialog is divided into two main sections. The left section, titled "Name", contains a text field with "Cisco CUCM Example", a toggle for "All Organizations", a dropdown menu for "Select the organizations the credential belongs to", and a "Timeout (ms)" field with the value "30000". The right section, titled "Credential Tester", contains a "Select Credential Test" dropdown, a "Select Collector" dropdown with the value "CUG | RNG-ISO-B-CU: 10.2.10.16", and an "IP or Hostname to test" field. A "Test Credential" button is located at the bottom right of the "Credential Tester" section. A "Close" button is located at the bottom right of the dialog box.

4. Supply values in the following fields:

- **Name.** Type a new name for the credential.
- **All Organizations.** Toggle on (blue) to align the credential to all organizations, or toggle off (gray) and then select one or more specific organizations from the **What organization manages this service?** drop-down field to align the credential with those specific organizations.
- **Timeout (ms).** Type the timeout value of each request, in milliseconds. The default value is "30000".
- **Hostname/IP.** Type the hostname or IP address, or you can type the variable "%D".
- **Port.** Type the port number.

NOTE: The example credential included in older versions of the "Cisco: CUCM Unified Communications Manager" PowerPack used "80" as the default **Port** number. If your Cisco Unified CM credential specifies port 80, Skylar One will automatically override that value and use port 8443 instead. If your Cisco Unified CM credential specifies any port other than 80, Skylar One will use that specified port.

- **Username.** Type the username for the Cisco Unified CM user account that you created to access the AXL web service. For details, see the [Configuring a Cisco Unified CM User Account](#) section.
- **Password.** Type the password for the username you entered in the **Username** field.

4. Click [Save & Close].

Creating a CUCM Credential in the Skylar One Classic User Interface

To use the Dynamic Applications in the "Cisco: CUCM Unified Communications Manager" PowerPack, you must first define a Basic/Snippet Cisco Unified CM credential in Skylar One. This credential allows Skylar One to communicate with the Cisco Unified CM cluster. The "Cisco: CUCM Unified Communications Manager" PowerPack includes a template you can use to create this Basic/Snippet credential.

To modify the Cisco Unified CM Basic/Snippet Credential template for use with your Cisco Unified CM cluster:

1. Go to the **Credential Management** page (System > Manage > Credentials).
2. Click the wrench icon () for the *Cisco CUCM Example* credential. The **Credential Editor** modal window appears.
3. Supply values in the following fields:
 - **Credential Name.** Type a new name for the credential.
 - **Hostname/IP.** Type the hostname or IP address, or you can type the variable "%D".

- **Port.** Type the port number.

NOTE: The example credential included in older versions of the "Cisco: CUCM Unified Communications Manager" PowerPack used "80" as the default **Port** number. If your Cisco Unified CM credential specifies port 80, Skylar One will automatically override that value and use port 8443 instead. If your Cisco Unified CM credential specifies any port other than 80, Skylar One will use that specified port.

- **Timeout (ms).** Type the timeout value of each request, in milliseconds. The default value is "30000".
- **Username.** Type the username for the Cisco Unified CM user account that you created to access the AXL web service. For details, see the [Configuring a Cisco Unified CM User Account](#) section.
- **Password.** Type the password for the username you entered in the **Username** field.

4. Click the **[Save As]** button.

NOTE: If you are monitoring Cisco Unified CM license information with the Cisco Prime License Manager (PLM) and your PLM administrator username and password are the same as the user account you created to access the AXL web service, then you can use the same credential to access PLM. However, if your PLM administrator user information is different, then repeat these steps to create a credential to access PLM.

NOTE: If SNMP is enabled on the Cisco Unified CM cluster, then you can also create an optional SNMP credential that will be used only during discovery to classify the cluster device class. If SNMP is not available on the Cisco Unified CM cluster, then you **do not** need an SNMP credential. For more information on SNMP credentials, see the [Discovery and Credentials](#) manual.

Manually Creating Host File Entries for CUCM Nodes

During the discovery process, Skylar One automatically aligns the IP addresses and hostnames for each CallManager server (node) in a Cisco Unified CM cluster via DNS.

If you do not have access to DNS for the Cisco Unified CM system you want to monitor, you must manually create host file entries in Skylar One for each node in the Cisco Unified CM cluster. Each host file entry must contain the IP address and hostname of a node in the Cisco Unified CM cluster.

NOTE: If you have access to DNS for the Cisco Unified CM system you want to monitor with Skylar One, you do not need to perform the steps to manually configure host file entries. Continue to the section on [Discovering a Cisco Unified CM Cluster](#).

Repeat the following steps for each node in the Cisco Unified CM cluster.

To create a host file entry:

1. Go to the **Host File Entry Manager** page (System > Customize > Host Files).
2. Click the **[Action]** menu and choose **Create New Entry**. The **Create New Host File Entry** modal page appears.
3. In the **Create New Host File Entry** modal page, supply values in the following fields:
 - **IP Address**. The IP address to resolve with the hostname.

NOTE: Server hostnames should be aligned to external IP addresses when supporting Network Address Translation (NAT) environments.

- **Hostnames and Aliases**. The hostname to align with the specified IP address. You can also include a space-delimited list of aliases for the host name.
 - **Description**. Description of the host entry. This field is not written to the host file. This field is for administrators to use when managing host file entries.
 - **Organization**. Organization associated with the host. You can select from a list of all existing organizations. This field is not written to the host file. This field is for administrators to use when managing host file entries. For example, a service provider could assign each customer its own organization and then use this field to manage host file entries for each customer.
4. Click the **[Save]** button to save the new host entry.

Chapter

3

Discovery

Overview

The following sections describe how to discover Cisco Unified Communications Manager (CUCM) clusters in Skylar One using the "Cisco: CUCM Unified Communications Manager" PowerPack:

This chapter covers the following topics:

<i>Discovering a CUCM Cluster</i>	19
<i>Verifying Discovery and Dynamic Application Alignment</i>	23
<i>Viewing Component Devices</i>	33

Discovering a CUCM Cluster

When you use the "Cisco: CUCM Unified Communications Manager" PowerPack to discover Cisco Unified CM devices, Skylar One creates a device representing your Cisco Unified CM cluster. This cluster device acts as the root device for the remaining servers and component devices in your Cisco Unified CM system.

To create and run a discovery session that will discover a Cisco Unified CM cluster:

1. On the **Devices** page (🖨️) or the **Discovery Sessions** page (Devices > Discovery Sessions), click the **[Add Devices]** button. The **Select** page appears:

2. Click the **[Unguided Network Discovery]** button. Additional information about the requirements for discovery appears in the **General Information** pane to the right.
3. Click **[Select]**. The **Add Devices** page appears.
4. Complete the following fields:
 - **Name.** Type a unique name for this discovery session. This name is displayed in the list of discovery sessions on the **[Discovery Sessions]** tab.
 - **Description.** Optional. Type a short description of the discovery session. You can use the text in this description to search for the discovery session on the **[Discovery Sessions]** tab.
 - **Select the organization to add discovered devices to.** Select the name of the organization to which you want to add the discovered devices
5. Click **[Next]**. The **Credentials** page of the **Add Devices** wizard appears:

6. On the **Credentials** page:

- Select an SNMP credential to use with the Cisco Unified CM cluster. (For more information on SNMP credentials, see the *Discovery and Credentials* manual.).

NOTE: An SNMP credential is needed only to properly classify the devices in the cluster. If SNMP is not available on the Cisco Unified CM cluster, then you do not need to select an SNMP credential; in that scenario, the root device will be discovered as a pingable device and you must manually change it to a Cisco Unified CM cluster.

- Select the *Cisco Cisco Unified CM Example* credential that you edited in the section on [Creating a Cisco Unified CM Credential](#).

7. Click **[Next]**. The **Discovery Session Details** page of the **Add Devices** wizard appears:

8. Complete the following fields:
 - **List of IPs/Hostnames.** Type the IP addresses for the Cisco Unified CM Publishers.
 - **Which collector will monitor these devices?.** Required. Select an existing collector to monitor the discovered devices.
 - **Run after save.** Select this option to run this discovery session as soon as you save the session.
9. Click **[Save and Run]** if you enabled the Run after save setting, or **[Save and Close]** to save the discovery session. The **Discovery Sessions** page (Devices > Discovery Sessions) displays the new discovery session.
10. If you selected the **Run after save** option on this page, the discovery session runs, and the **Discovery Logs** page displays any relevant log messages. If the discovery session locates and adds any devices, the **Discovery Logs** page includes a link to the **Device Investigator** page for the discovered device.

NOTE: If you attempt to discover a CUCM cluster whose servers have been cloned from a separate CUCM cluster that has also been discovered within the same Skylar One stack, the "Cisco: CUCM Subscriber Merge" Dynamic Application may incorrectly attempt to merge subscriber devices with components in another DCM tree. To avoid this, you must manually merge the subscriber server devices with their associated component devices in the correct cluster. The physical device of the CUCM Publisher should ***not*** be merged with its associated component device.

Discovering a CUCM Cluster in the Skylar One Classic User Interface

When you use the "Cisco: CUCM Unified Communications Manager" PowerPack to discover Cisco Unified CM devices, Skylar One creates a device representing your Cisco Unified CM cluster. This cluster

device acts as the root device for the remaining servers and component devices in your Cisco Unified CM system.

To create and run a discovery session that will discover a Cisco Unified CM cluster:

1. Go to the **Discovery Control Panel** page (System > Manage > Classic Discovery or System > Manage > Discovery in the classic user interface).
2. Click the **[Create]** button to create a new discovery session. The **Discovery Session Editor** window appears.
3. Enter values in the following fields:
 - **IP Address/Hostname Discovery List.** Type the IP addresses for the Cisco Unified CM Publishers.

NOTE: To monitor Cisco Unified CM servers that are registered by name within their clusters, you might need to go to the **Host File Entry Manager** page (System > Customize > Host Files) and map the server names to their IP addresses if you do not have access to DNS for the Cisco Unified CM system you want to monitor. For Network Address Translation (NAT) environments, server hostnames should be mapped to external IP addresses. For more information, see the section [Manually Creating Host File Entries for Cisco Unified CM Nodes](#).

- **SNMP Credential.** Select an SNMP credential to use with the Cisco Unified CM cluster. (For more information on SNMP credentials, see the *Discovery and Credentials* manual.)

NOTE: An SNMP credential is needed only to properly classify the devices in the cluster. If SNMP is not available on the Cisco Unified CM cluster, then you do not need to select an SNMP credential; in that scenario, the root device will be discovered as a pingable device and you must manually change it to a Cisco Unified CM cluster.

- **Other Credentials.** Select the *Cisco Cisco Unified CM Example* credential that you edited in the section on [Creating a Cisco Unified CM Credential](#).
4. You can enter values in the other fields on this page, but are not required to and can simply accept the default values. For more information about the other fields on this page, see the *Discovery and Credentials* manual.
 5. Click **[Save]** and then close the **Discovery Session Editor** window.
 6. The discovery session you created appears at the top of the **Discovery Control Panel** page. Click its lightning bolt icon (⚡) to run the discovery session.
 7. The **Discovery Session** window appears.
 8. When the Cisco Unified CM cluster is discovered, click its device icon (🖨) to view the **Device Properties** page for the Cisco Unified CM cluster.

NOTE: If you attempt to discover a CUCM cluster whose servers have been cloned from a separate CUCM cluster that has also been discovered within the same Skylar One stack, the "Cisco: CUCM Subscriber Merge" DA may incorrectly attempt to merge subscriber devices with components in another DCM tree. To avoid this, you must manually merge the subscriber server devices with their associated component devices in the correct cluster. The physical device of the CUCM Publisher should ***not*** be merged with its associated component device.

Verifying Discovery and Dynamic Application Alignment

The Dynamic Applications for monitoring Cisco Unified CM are aligned during discovery.

To verify that Skylar One has automatically aligned the correct Dynamic Applications:

1. In the **Devices** page, locate the newly discovered Cisco Unified CM cluster and click on it to view the **Device Investigator** page.
2. From the **Device Investigator** page for the Cisco Unified CM cluster, click the **[Collections]** tab. The **Dynamic Application Collections** page appears.

3. The following Dynamic Applications should appear on the **Dynamic Application Collections** page for the Cisco Unified CM cluster:

NOTE: It can take several minutes after discovery for Dynamic Applications to display on the **Dynamic Application Collections** page. If the listed Dynamic Applications do not display on this page, try clicking the **[Reset]** button.

- Cisco: CUCM Cluster Information
- Cisco: CUCM Cluster Root Cache
- Cisco: CUCM CTI Device Cache
- Cisco: CUCM H323 Trunk Cache
- Cisco: CUCM Misc Perf Counters Fast Cache
- Cisco: CUCM Misc Perf Counts Slow Cache
- Cisco: CUCM Partition Cache
- Cisco: CUCM Process Cache
- Cisco: CUCM Service Performance Cache
- Cisco: CUCM Service States Cache
- Cisco: CUCM SIP Trunk Cache

Manually Aligning Dynamic Applications

If the Dynamic Applications have not been automatically aligned, you can align them manually.

To manually align Dynamic Applications:

1. From the **Device Manager** page (Devices > Classic Devices, or Registry > Devices > Device Manager in the classic user interface), find the Cisco Unified CM cluster and click its wrench icon ().
2. From the **Device Properties** page for the Cisco Unified CM cluster, click the **[Collections]** tab.
3. Click the **[Actions]** button and then click *Add Dynamic Applications*. The **Dynamic Application Alignment** page appears.
4. In the **Dynamic Applications** field, select the Dynamic Application you want to align.
5. In the **Credentials** field, select the SNMP credential you created for monitor the Cisco Unified CM cluster.
6. Repeat steps 2-4 for the remaining Dynamic Applications to align with the device.
7. After aligning the Dynamic Applications, click the **[Reset]** button and then click the plus icon (+) for the Dynamic Application. If collection for the Dynamic Application was successful, the graph icons () for the Dynamic Application are enabled.
8. Click a graph icon () to view the collected data. The **Configuration Report** page will display the number of components of each type and the total number of components managed by the Cisco Unified CM cluster.

Dynamic Application Producers and Consumers

If you enable or disable any of the cache-producing Dynamic Applications, the corresponding cache-consuming Dynamic Applications will also be impacted.

NOTE: To check the cache producer(s) for a given cache-consuming application that uses the legacy built-in caching mechanism, find the associated cache producer under **Cached object** drop-down field in the **[Snippets]** tab of the **Snippet Editor** modal.

Dynamic Applications Disabled by Default

The following Dynamic Applications are disabled by default to optimize the performance of your Skylar One system, as well as the Call Manager servers you are polling. If you wish to enable any of the cache-consuming Dynamic Applications below, you must enable the Dynamic Application that is listed, as well as the cache-producing Dynamic Application at the top level in the list:

- Cisco: CUCM Gatekeeper Cache:
 - Cisco: CUCM Gatekeeper Configuration
 - Cisco: CUCM Gatekeeper Container Discovery
 - Cisco: CUCM Gatekeeper Instances Discovery
 - Cisco: CUCM Gatekeeper Performance

 - Cisco: CUCM PRI Gateway Configuration
- Cisco: CUCM Phone Inventory

Enabling a Dynamic Application

If you want to align to any of the Dynamic Applications listed above, you must enable them from the Dynamic Applications Manager first.

To enable a Dynamic Application:

1. Go to the **Dynamic Applications Manager** page. (System > Manage > Applications)
2. Click the wrench icon () for the Dynamic Application you would like to enable.

3. Select *[Enabled]* from the **Operational State** drop-down menu.
4. Click the **[Save]** button and close the window.

Viewing Component Devices

When Skylar One performs collection for a Cisco Unified CM cluster, Skylar One will create component devices for the components in the Cisco Unified CM cluster and align other Dynamic Applications to those component devices. Some of the Dynamic Applications aligned to the component devices will also be used to create additional component devices. All component devices appear in the **Device Manager** page just like devices discovered using the ScienceLogic discovery process.

In addition to the **Devices** page, you can view the Cisco Unified CM cluster and all associated component devices in the following places in the user interface

- The **Device Investigator Map** page (click **Map** in the **Device Investigator** page) displays a map of a particular device and all of the devices with which it has parent-child relationships. Double-clicking any of the listed devices reloads the page to make the selected device the primary device.

- The **Device Components** page (Devices > Device Components) displays a list of all root devices and component devices discovered by Skylar One. The **Device Components** page displays all root devices and component devices in an indented view, so you can easily view the hierarchy and relationships between child devices, parent devices, and root devices. To view the component devices associated with a Cisco Unified CM cluster, find the Cisco Unified CM cluster and select its plus icon (+).

Device Components									
Device Components Devices Found [1]									
Device Name *	IP Address	Device Category	Device Class / Sub-class	DID	Organization	Current State	Collection Group	Collection State

3. + Services	--	Service	Cisco Systems Services Container	38	CUCMv14	Healthy	CUG2	Active	
2. -- CUCM14-02	--	CallControl	Cisco Systems Call Manager	36	CUCMv14	Healthy	CUG2	Active	
1. -- Devices	--	Device	Cisco Systems Device Container	41	CUCMv14	Healthy	CUG2	Active	
1. -- H323 Trunks	--	Trunk	Cisco Systems H323 Trunk Container	50	CUCMv14	Healthy	CUG2	Active	
2. -- SIP Trunks	--	Trunk	Cisco Systems SIP Trunk Container	54	CUCMv14	Healthy	CUG2	Active	
2. -- Services	--	Service	Cisco Systems Services Container	40	CUCMv14	Healthy	CUG2	Active	

- The **Component Map** page (Classic Maps > Device Maps > Components) allows you to view devices by root node and view the relationships between root nodes, parent components, and child components in a map. This makes it easy to visualize and manage root nodes and their components. Skylar One automatically updates the **Component Map** as new component devices are discovered. The platform also updates each map with the latest status and event information. To view the map for a Cisco Unified CM cluster, go to the **Component Map** page and select the map from the list in the left NavBar. To learn more about the **Component Map** page, see the **Maps** manual.

Dashboards in the Skylar One Classic User Interface

Overview

The "Cisco: CUCM Unified Communications Manager" PowerPack comes paired with the "Cisco: CUCM Dashboards" PowerPack, which contains dashboards that present data related to different aspects of Cisco Unified CM clusters.

NOTE: These dashboards appear only in the Skylar One classic user interface.

The following sections describe how to install the "Cisco: CUCM Dashboards" PowerPack and provide a description of each dashboard:

This chapter covers the following topics:

<i>Installing the CUCM Dashboards</i>	36
<i>Cisco: CUCM Performance Dashboard</i>	36
<i>Cisco: CUCM Locations LBM</i>	37
<i>Cisco: CUCM Media Resources</i>	37
<i>Cisco: CUCM Media Resources (Simple)</i>	38
<i>Cisco: CUCM Tomcat</i>	39
<i>Cisco: CUCM Overall Cluster Health</i>	39

Installing the CUCM Dashboards

To view the Cisco Unified CM dashboards in Skylar One, you must install the "Cisco: CUCM Dashboards" PowerPack. To do so:

1. Go to the **PowerPack Manager** page (System > Manage > PowerPacks).
2. Click the **[Actions]** button, then select *Install PowerPack*. The **Imported PowerPacks** modal page appears.
3. Use the search filter in the **PowerPack Name** column heading to locate the PowerPack you want to install. To do so, enter text to match, including special characters, and the **Imported PowerPacks** modal page displays only PowerPacks that have a matching name.
4. Click the lightning-bolt icon (⚡) for the PowerPack that you want to install.
5. The **Install PowerPack** modal page appears. To install the PowerPack, click **[Install]**.
6. The PowerPack now appears in the **PowerPack Manager** page. The contents of the PowerPack are automatically installed in your Skylar One System.

Cisco: CUCM Performance Dashboard

The Cisco: CUCM Performance dashboard displays 11 widgets.

The dashboard includes the following widgets:

- **Top 25: CPU (Average, All devices, Last 12 Hours)**. This widget displays a bar graph that depicts the 25 Cisco CallManager devices that used the highest percentage of CPU time over the last 12 hours.
- **Top Processes By Utilization**. This widget displays a bar graph that depicts all Cisco Unified CM processes in the cluster, ordered by utilization from highest to lowest.
- **CUCM Vitals**. This widget displays a line graph that depicts the cluster's vitals by percent, including CPU time, Swap Utilization, and Memory Utilization, over time.
- **Read and Write Operations Per Second**. This widget displays a line graph that depicts read and write requests per second over time.
- **Average IO Wait Time**. This widget displays a line graph that depicts the average IO wait time over time.
- **SIP Signaling Performance**. This widget displays a line graph that depicts SIP signaling performance over time.
- **SIP Stack Performance**. This widget displays a line graph that depicts SIP stack performance over time.
- **Signaling Performance**. This widget displays a line graph that depicts overall signaling performance over time.

- **System Performance.** This widget displays a line graph that depicts multiple system performance metrics over time.
- **SIP Station Performance.** This widget displays a line graph that depicts multiple SIP station performance metrics over time.
- **TCP Performance.** This widget displays a line graph that depicts TCP performance over time.

Cisco: CUCM Locations LBM

The Cisco: CUCM Locations LBM (Location Bandwidth Manager) dashboard displays eight widgets.

The dashboard includes the following widgets:

- **Top Locations by Audio Bandwidth.** This widget displays a horizontal bar graph that depicts a list of locations, ordered by audio bandwidth usage by percent, from highest to lowest.
- **Location - Audio Bandwidth Utilization.** This widget displays a line graph that depicts audio bandwidth utilization over time.
- **Top Locations by Available Bandwidth.** This widget displays a horizontal bar graph that depicts a list of locations, ordered by available bandwidth in kpbs, from highest to lowest.
- **Location - Available Bandwidth.** This widget displays a line graph that depicts available bandwidth over time.
- **Top Locations by Video Bandwidth.** This widget displays a line graph that a list of locations, ordered by video bandwidth by percent, from highest to lowest.
- **Location - Video Bandwidth Utilization.** This widget displays a line graph that depicts video bandwidth utilization over time.
- **Top Locations by Telepresence Bandwidth Utilization.** This widget displays a horizontal bar graph that depicts a list of locations, ordered by TelePresence bandwidth usage in percent, from highest to lowest.
- **Location - Telepresence BW Utilization.** This widget displays a line graph that depicts TelePresence bandwidth utilization over time.

Cisco: CUCM Media Resources

The Cisco: CUCM Media Resources dashboard displays 12 widgets that display the most utilized and active versus total metrics for transcoding, announcement servers, streaming music to callers on hold, video, conferencing, and media termination points.

The dashboard includes the following widgets:

- **Announcement Servers - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized announcement servers.
- **Announcement Server - Active Versus Total.** This widget displays a line graph that depicts the active announcement servers versus the total announcement servers over time.
- **Software Conference Bridge - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized software conference bridges by percent.

- **Software Conference Bridge - Active Versus Total.** This widget displays a line graph that depicts the active versus total software conference bridges over time.
- **Music On Hold Servers - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized music-on-hold servers by percent.
- **Music On Hold Servers - Active Versus Total.** This widget displays a line graph that depicts the active versus total music-on-hold servers over time.
- **MTPs - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized Media Transfer Protocols (MTPs) by percent.
- **MTP Usage Versus Total.** This widget displays a line graph that depicts the usage versus total Media Transfer Protocols (MTPs) over time.
- **Video Conf Bridge - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized video conference bridges by percent.
- **Video Conf Bridge - Active Versus Total.** This widget displays a line graph that depicts the active versus total video conference bridges over time.
- **Transcoders - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized transcoders by percent.
- **Transcoders - Active Versus Total.** This widget displays a line graph that depicts the active versus total transcoders over time.

Cisco: CUCM Media Resources (Simple)

The Cisco: CUCM Media Resources dashboard displays eight widgets which display the most utilized and active versus total metrics for announcement servers, streaming music to callers on hold, conferencing, and media termination points.

The dashboard includes the following widgets:

- **Top SIP Trunks by Number of Active Calls.** This widget displays a horizontal bar graph that depicts the most utilized SIP trunks.
- **SIP Trunk Active Calls (Per Trunk).** This widget displays a line graph that depicts the number of active calls per SIP Trunk over time.
- **Software Conference Bridge - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized software conference bridges by percent.
- **Software Conference Bridge - Active Versus Total.** This widget displays a line graph that depicts the active versus total software conference bridges over time.
- **Music On Hold Servers - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized music-on-hold servers by percent.
- **Music On Hold Servers - Active Versus Total.** This widget displays a line graph that depicts the active versus total music-on-hold servers over time.
- **MTPs - Most Utilized.** This widget displays a horizontal bar graph that depicts the most utilized Media Transfer Protocols (MTPs) by percent.
- **MTP Usage Versus Total.** This widget displays a line graph that depicts the usage versus total Media Transfer Protocols (MTPs) over time.

Cisco: CUCM Tomcat

The Cisco: CUCM Tomcat dashboard displays 12 widgets that monitor servers and services that use the Tomcat Java Webserver.

The dashboard includes the following widgets:

- **Tomcat - Top Servers by Number of Requests.** This widget displays a horizontal bar graph that depicts the servers with the highest number of requests.
- **Tomcat % Memory Utilization.** This widget displays a line graph that depicts the percentage of memory utilization over time.
- **Tomcat % Total Errors.** This widget displays a line graph that depicts the percentage of errors over time.
- **Tomcat Connector - Total Sessions Active.** This widget displays a line graph that depicts the total active Tomcat Connector sessions over time.
- **Tomcat - Top 10 Services By Number of Requests.** This widget displays a horizontal bar graph that depicts the ten services with the most requests.
- **Tomcat - Number of Requests (Per Service).** This widget displays a line graph that depicts the number of requests per service over time.
- **Tomcat - Top 10 Services by Errors.** This widget displays a horizontal bar graph that depicts the ten services with the most errors.
- **Tomcat - Errors (Per Service).** This widget displays a line graph that depicts errors per service over time.
- **Tomcat - Top 5 Services by Sessions Active.** This widget displays a horizontal bar graph that depicts the five services with the most active sessions.
- **Tomcat - Sessions Active.** This widget displays a line graph that depicts active Tomcat sessions over time.
- **Tomcat - Top Connectors By Errors/Threads Busy.** This widget displays a horizontal bar graph that depicts the Connectors with the most errors and busy threads.
- **Tomcat - Connector Errors or Threads Busy (Per Connector).** This widget displays a line graph that depicts connector errors or busy threads per connector over time.

Cisco: CUCM Overall Cluster Health

The Cisco: CUCM Overall Cluster Health dashboard contains nine widgets that monitor aspects of the cluster's overall health.

The dashboard includes the following widgets:

- Eight gauge widgets use IT Service Monitor Policies to display the following:
 - Cluster Health

- Trunk Health
- Gateway Health
- Media Resources Health
- Cluster Call Completions
- CUCM Server Health
- TFTP Health
- Tomcat Health
- At the bottom of the dashboard, a line graph depicts the overall cluster health by percentage over time.

Cisco: CUCM Active Calls

The Cisco: CUCM Active Calls widget displays 12 graphs that monitor active calls, conferences, and active channels.

The widgets display:

- **Top 10 Call Managers By Active Calls.** This widget displays a horizontal bar graph that depicts the ten call managers with the highest number of active calls.
- **Total Active Calls (By CUCM).** This widget displays a line graph that depicts total active calls by CUCM over time.
- **Media Resources Active - MOH, SW and HW Conferences.** This widget displays a line graph that depicts active MOH, SW, and HW conference media resources over time.
- **Media Resources Active - VCB, Xcoders, MCU Conferences.** This widget displays a line graph that depicts active VCB, Xcoders, and MCU conferences over time.
- **PRI and T1 Active Channels.** This widget displays a line graph that depicts the active PRI and T1 channels over time.
- **FXS, FXO, and BRI Active Calls.** This widget displays a line graph that depicts FXS, FXO, and BRI active calls over time.
- **Video Calls Active.** This widget displays a line graph that depicts active video calls over time.
- **Top 10 Hunt Lists By Active Calls.** This widget displays a horizontal bar graph that depicts the ten hunt lists with the highest number of active calls.
- **Top SIP Trunks By Number of Active Calls.** This widget displays a horizontal bar graph that depicts the SIP trunks with the highest number of active calls.
- **SIP Trunk Active Calls (Per Trunk).** This widget displays a line graph that depicts active SIP trunk calls over time.
- **Top H323 Trunks By Number of Active Calls.** This widget displays a horizontal bar graph that depicts the H323 trunks with the highest number of active calls.
- **H323 Trunk Active Calls (Per Trunk).** This widget displays a line graph that depicts active H323 trunk calls over time.

Chapter

5

Troubleshooting

Overview

The following sections describe resolutions to some issues you might encounter when monitoring Cisco Unified Communications Manager:

This chapter covers the following topics:

<i>Resolving Network Connectivity Issues</i>	41
<i>Resolving Credential Issues</i>	42
<i>Resolving NAT Issues</i>	43
<i>Resolving Error Messages</i>	44
<i>Running Dynamic Applications in Debug Mode</i>	44

Resolving Network Connectivity Issues

If you experience network connectivity issues, you can follow the steps in this section to diagnose the cause.

To diagnose network connectivity issues:

1. Use a Secure Shell (SSH) client software such as PuTTY to log in to the ScienceLogic Data Collector.
2. Type the following command:

```
ping <Cisco Unified CM Server IP>
```

If this fails, check to see if the network is blocking ICMP traffic anywhere, as this might identify a firewall that is not documented.

3. Type the following command:

```
nmap -sU -Pn -p 161 <Cisco Unified CM Server IP>
```

This will validate whether or not you have SNMP connectivity. If you do not, you might be on an access control list (ACL).

4. Type the following command:

```
nmap -sS -Pn -p 8443 <Cisco Unified CM Server IP>
```

This will determine if you have AXL connectivity.

5. Type the following command:

```
traceroute <Cisco Unified CM Server IP>
```

This will identify any additional unknown firewalls or unexpected routing paths.

If you cannot identify the causes of your network connectivity issues using these steps, you might be experiencing a DNS resolution issue. For more information, see the [Manually Creating Host File Entries for CUCM Nodes](#) section.

Resolving Credential Issues

Basic/Snippet (AXL User) Credentials

The following list includes commands that you can use to validate your Basic/Snippet Cisco Unified CM credentials:

- To validate that the credential can communicate with the AXL API service:

```
curl -k -u <USER>:<PASSWORD> -H "Content-type: text/xml;"  
https://<Cisco Unified CM Server  
IP>:8443/axl/services/AXLAPIService?wsdl
```

- To validate that the credential can communicate with the Real Time Information port:

```
curl -k -u <USER>:<PASSWORD> -H "Content-type: text/xml;"
https://<Cisco Unified CM Server
IP>:8443/realtimeservice/services/RisPort?wsdl
```

- To validate that the credential can communicate with the Performance Monitor port:

```
curl -k -u <USER>:<PASSWORD> -H "Content-type: text/xml;"
https://<Cisco Unified CM Server
IP>:8443/perfmonservice/services/PerfmonPort?wsdl
```

- To validate that the credential can communicate with the Control Center service port:

```
curl -k -u <USER>:<PASSWORD> -H "Content-type: text/xml;"
https://<Cisco Unified CM Server
IP>:8443/controlcenterservice/services/ControlCenterServicesPort?wsdl
```

SNMP Credentials

You can use the following commands to validate your SNMP credentials:

- For SNMP v2:

```
snmpwalk -v 2c -c <read string> <Cisco Unified CM Server IP> system
```

- For SNMP v3:

```
snmpwalk -v3 -l authNoPriv -u <username> -a SHA -A <password> <Cisco
Unified CM Server IP>
```

Resolving NAT Issues

NOTE: See the section [Configuring CUCM for NAT](#) for steps on enabling support for network address translation (NAT).

If a customer must have a firewall between the ScienceLogic Data Collector and the Cisco Unified CM Cluster, then check the firewall to determine if the firewall is performing network address translation (NAT).

If NAT is enabled:

1. The customer must provide a hostname and an IP address accessible from the Data Collector for the Cluster and each subscribing CallManager.
2. Add the CallManager hostnames and IP addresses to host file entries. (For more information, see the [Manually Creating Host File Entries for CUCM Nodes](#) section.)
3. Allow time for the host file to be propagated to the Data Collector.

NOTE: You can also follow these instructions if the CallManager is defined by an IP address but not a hostname.

If you have enabled support for NAT and set the "Use Server Hostname for NAT" threshold object to "1", but are experiencing collection issues after upgrading the PowerPack, the threshold may have been reset. To avoid this happening during a PowerPack upgrade, go to the **Behavior Settings** page (System > Settings > Behavior) and click the **Enable Selective PowerPack Field Protection** checkbox.

Resolving Error Messages

The following error message might be generated during collection for the Cisco Unified Communications Manager Dynamic Applications.

Error / Message	Cause / Resolution
When running the "Cisco: CUCM Cluster Root Cache" Dynamic Application, you receive an error message stating "[Application number, snippet number] reported a collection problem. (Explanation: The server is not specified as a Publisher.)"	Skylar One cannot determine the node's IP address. You must add the node hostname and IP address to a host file. (For more information, see the Manually Creating Host File Entries for CUCM Nodes section.)

Running Dynamic Applications in Debug Mode

To identify issues with a specific Dynamic Application, go to the **Dynamic Application Collections** page (Registry > Devices > wrench icon > Collections) and run the Dynamic Application by clicking its lightning bolt icon (⚡). Doing so provides you with details about any issues the Dynamic Application might be experiencing with the provided URL, IP address, or credentials.

Another method, which will provide even more data, is to run the Dynamic Application in debug mode. To run a Dynamic Application in debug mode, type the following command from the command line interface for the Data Collector:

```
sudo -u s-em7-core SILO_DEBUG=1 /opt/em7/backend/dynamic_single.py  
<device ID> <Dynamic Application ID>
```
