Overview

Introduction

This manual describes how to monitor the Docker platform in the ScienceLogic platform using the *Docker PowerPack*.

The following sections provide an overview of the Docker platform and the *Docker PowerPack*:

<i>What is Docker?</i>	3
<i>What Does the Docker PowerPack Monitor?</i>	4
<i>Installing the Docker PowerPack</i>	4

NOTE: ScienceLogic provides this documentation for the convenience of ScienceLogic customers. Some of the configuration information contained herein pertains to third-party vendor software that is subject to change without notice to ScienceLogic. ScienceLogic makes every attempt to maintain accurate technical information and cannot be held responsible for defects or changes in third-party vendor software. There is no written or implied guarantee that information contained herein will work for all third-party variants. See the End User License Agreement (EULA) for more information.

What is Docker?

Docker is a platform that automates the process of deploying applications using software containers. These containers include individual deployment components (e.g., software code, system libraries, etc.) that, when combined, contain everything needed to run the application.

What Does the Docker PowerPack Monitor?

The *Docker* PowerPack includes:

- An example Basic/Snippet Credential and an example SSH/Key Credential for discovering Docker devices
- Dynamic Applications and Run Book Actions to discover, model, and monitor the following Docker component devices:
 - Hosts
 - Containers
 - Swarms
 - Stacks
 - Services
- Device Classes for each type of Docker component device the ScienceLogic platform monitors
- Event Policies that are triggered when Docker component devices meet certain status criteria

Installing the Docker PowerPack

Before completing the steps in this manual, you must import and install the latest version of the *Docker* PowerPack.

TIP: By default, installing a new version of a PowerPack overwrites all content in that PowerPack that has already been installed on the target system. You can use the **Enable Selective PowerPack Field Protection** setting in the **Behavior Settings** page (System > Settings > Behavior) to prevent new PowerPacks from overwriting local changes for some commonly customized fields. (For more information, see the **System Administration** manual.)

To download and install a PowerPack:

1. Download the PowerPack from the [ScienceLogic Customer Portal](#).
2. Go to the **PowerPack Manager** page (System > Manage > PowerPacks).
3. In the **PowerPack Manager** page, click the **[Actions]** button, then select *Import PowerPack*.
4. The **Import PowerPack** dialog box appears:

5. Click the **[Browse]** button and navigate to the PowerPack file.
6. When the **PowerPack Installer** modal page appears, click the **[Install]** button to install the PowerPack.

NOTE: If you exit the **PowerPack Installer** modal page without installing the imported PowerPack, the imported PowerPack will not appear in the **PowerPack Manager** page. However, the imported PowerPack will appear in the **Imported PowerPacks** modal page. This page appears when you click the **[Actions]** menu and select *Install PowerPack*.

Configuring Docker Monitoring

Overview

The following sections describe how to configure and discover the Docker platform and its component devices for monitoring by the ScienceLogic platform using the *Docker PowerPack*:

<i>Prerequisites for Monitoring Docker</i>	6
<i>Enabling the Docker API</i>	7
<i>Configuring a Docker Credential</i>	9
<i>Creating a Basic/Snippet Credential</i>	9
<i>Creating an SSH/Key Credential</i>	10
<i>Discovering Docker Components</i>	11
<i>Manually Aligning Dynamic Applications</i>	13
<i>Viewing Docker Component Devices</i>	15
<i>Relationships Between Component Devices</i>	17

Prerequisites for Monitoring Docker

Before you can monitor the Docker platform and its component devices in the ScienceLogic platform using the *Docker PowerPack*, you must first follow the instructions in the [Enabling the Docker API](#) section. These steps enable the Dynamic Applications in the *Docker PowerPack* to communicate with and gather data from the Docker API.

If you are using Secure Shell (SSH) to monitor Docker or Kubernetes nodes in conjunction with the *Kubernetes PowerPack*, you must also install cURL 7.40 or greater on all of the Docker hosts that you want to monitor, prior to discovery. You must then run the following cURL commands on each of those hosts:

- `curl --unix-socket /var/run/docker.sock http://docker/containers/json`
- `curl --unix-socket /var/run/docker.sock http://docker/containers/[container_id]/json`
- `curl --unix-socket /var/run/docker.sock http://docker/containers/[container_id]/stats?stream=0`

Enabling the Docker API

Before you discover Docker components using the *Docker PowerPack*, you must first enable the Docker API. This section describes how to do so for Windows, CentOS, Red Hat Enterprise Linux (RHEL), and Oracle Linux operating systems.

Windows

To enable the Docker API for Windows using the Docker Toolbox:

1. Start Docker Quickstart Terminal.
2. To determine the IP address of the Docker host machine, type the following command:

`$ docker-machine ip`
3. Log in to the host machine:

`$ docker-machine ssh`
4. Navigate to Boot2Docker:

`$ cd /var/lib/boot2docker`
5. Edit the Boot2Docker profile:

`$ sudo vi profile`
6. In the profile, change "DOCKER_HOST" to "DOCKER_HOST='-H tcp://0.0.0.0:[port number]'", and set DOCKER_TLS=no.
7. Exit the SSH session, and then restart Docker:

`$ exit`
`$ docker-machine restart`
8. To verify that the Docker API is accessible, open a browser and navigate to `http:[IP address]:[port number]/version`.

If the Docker API is successfully enabled, the version returns something similar to the following:

```
{ "Version": "17.10.0-ce", "ApiVersion": "1.33", "MinAPIVersion": "1.12", "GitCommit": "f4fffd25", "GoVersion": "go1.8.3", "Os": "linux", "Arch": "amd64", "KernelVersion": "4.4.93-boot2docker", "BuildTime": "2017-10-17T19:05:23.000000000+00:00" }
```

CentOS

To enable the Docker API for CentOS:

1. Log in to the command-line interface of the server running Docker and navigate to systemd/system:

```
$ cd /etc/systemd/system
```

2. Create a new "docker.service.d" folder, then navigate to that folder:

```
$ mkdir docker.service.d
$ cd docker.service.d
```

3. Create a new docker.conf file:

```
$ vi docker.conf
```

4. Type the following:

```
INSERT
[Service]
ExecStart=
ExecStart=/usr/bin/dockerd -H tcp://0.0.0.0:[port number] -H
unix://var/run/docker.sock
```

5. Reload daemon, restart Docker, and open the port on the firewall by typing the following:

```
$ systemctl daemon-reload
$ systemctl restart docker
$ firewall-cmd --add-port=[port number]/tcp
```

6. Verify that the Docker API is accessible by typing the following:

```
$ *curl http://localhost:[port number]/version*
```

If the Docker API is successfully enabled, the version returns something similar to the following:

```
{"Version":"17.06.1-ce","ApiVersion":"1.30","MinAPIVersion":"1.12","GitCommit":
:"874a737","GoVersion":"go1.8.3","Os":"linux","Arch":"amd64","KernelVersion":
"3.10.0-514.26.2.el7.x86_64","BuildTime":"2017-08-17T23:01:50.155177940+00:00"}
```

RHEL 7 and Oracle Linux 7

To enable the Docker API for RHEL 7 or Oracle Linux 7:

1. Log in to the command-line interface of the server running Docker and navigate to systemd/system:

```
$ cd /usr/lib/systemd/system
```

2. Edit the service.docker file:

```
$ sudo vi service.docker
```

3. Find the line that starts with "ExecStart=/usr/bin/dockerd" and add "-H tcp://0.0.0.0:[port number]" so that the updated line looks like this:

```
ExecStart=/usr/bin/dockerd -H tcp://0.0.0.0:4243
```

4. Reload daemon, restart Docker, and open the port on the firewall by typing the following:

```
$ systemctl daemon-reload
$ systemctl restart docker
$ firewall-cmd --add-port=[port number]/tcp
```

5. Verify that the Docker API is accessible by typing the following:

```
$ *curl http://[IP address]:[port number]/version*
```

If the Docker API is successfully enabled, the version returns something similar to the following:

```
{"Version":"17.06.2-ee-4","ApiVersion":"1.30","MinAPIVersion":"1.12","GitCommit":
"dd2c358","GoVersion":"go1.8.3","Os":"linux","Arch":"amd64","KernelVersion":
"3.10.0-514.el7.x86_64","BuildTime":"2017-10-12T16:19:56.386620861+00:00"}
```

Configuring a Docker Credential

The *Docker PowerPack* includes an example Basic/Snippet Credential and an example SSH/Key Credential for your use. You can modify these to create your own Credentials that will enable the ScienceLogic Platform to discover your Docker devices.

Creating a Basic/Snippet Credential

To configure the ScienceLogic platform to monitor the Docker platform using the Docker API, you must create a Basic/Snippet credential that allows the Dynamic Applications in the *Docker PowerPack* to connect with Docker hosts or swarms. An example Basic/Snippet credential that you can edit for your own use is included in the *Docker PowerPack*.

To create a Basic/Snippet credential to access Docker hosts or swarms:

1. Go to the **Credential Management** page (System > Manage > Credentials).
2. Locate the example **Docker Basic** credential, and then click its wrench icon (). The **Edit Basic/Snippet Credential** modal page appears.

- Complete the following fields:

The screenshot shows a window titled "Credential Editor [88]". Inside, there's a tab "Edit Basic/Snippet Credential #88" with "New" and "Reset" buttons. Below is a "Basic Settings" section with a "Credential Name" field containing "Docker Basic". There are three rows of fields: "Hostname/IP" with "http://%D", "Port" with "4243", and "Timeout(ms)" with "10000". Below these are "Username" with "em7admin" and "Password" with "*****". At the bottom are "Save" and "Save As" buttons.

- **Credential Name.** Type a new name for the Docker credential.
- **Hostname/IP.** Type "%D".
- **Port.** Type the port number you specified when you [enabled the Docker API](#).
- **Timeout(ms).** Type "10000".
- **Username.** Type a value for the username.
- **Password.** Type a value for the password.

NOTE: The Docker platform does not require a specific username and password to access the platform, but the ScienceLogic platform does require the **Username** and **Password** fields to have values when using Basic/Snippet credentials to monitor Docker. Therefore, those fields must have entries, but the values themselves do not matter.

- Click the **[Save As]** button.
- When the confirmation message appears, click **[OK]**.

Creating an SSH/Key Credential

If you are using SSH to monitor Docker swarms, then you must create an SSH/Key credential that allows the Dynamic Applications in the *Docker PowerPack* to connect with Docker swarms. An example SSH/Key credential that you can edit for your own use is included in the *Docker PowerPack*.

NOTE: You can also use an SSH credential in conjunction with the *Kubernetes PowerPack* to monitor the Docker infrastructure for a Kubernetes cluster.

To create an SSH/Key credential to monitor Docker containers:

1. Go to the **Credential Management** page (System > Manage > Credentials).
2. Locate the example **Docker Basic - SSH** credential, and then click its wrench icon (🔧). The **Edit SSH/Key Credential** modal page appears.
3. Complete the following fields:

- **Credential Name.** Type a new name for the Docker credential.
 - **Hostname/IP.** Type "%D".
 - **Port.** Type the SSH port number for the Docker swarm you want to monitor.
 - **Timeout(ms).** Type "10000".
 - **Username.** Type the username for a user with SSH access to the Docker swarm command line interface.
 - **Password.** Type the user's password.
 - **Private Key (PEM Format).** Keep this field blank.
4. Click the **[Save As]** button.
 5. When the confirmation message appears, click **[OK]**.

Discovering Docker Components

To discover and model your Docker component devices for monitoring, you must run a discovery session. The discovery session will discover the Docker hosts and swarms that the platform will use as the root devices for monitoring the Docker components.

Several minutes after the discovery session has completed, the Dynamic Applications in the Docker PowerPack will automatically align to the Docker root devices. These Dynamic Applications will discover, model, and monitor the remaining components in your Docker system.

To discover Docker components, perform the following steps:

1. Go to the **Discovery Control Panel** page (System > Manage > Discovery), and then click the **[Create]** button. The **Discovery Session Editor** page appears.
2. In the **Discovery Session Editor** page, complete the following fields:

The screenshot shows the 'Discovery Session Editor | Editing Session [19]' interface. It is divided into several sections:

- Identification Information:** Includes fields for 'Name' (set to 'Docker_45_49') and 'Description'.
- IP and Credentials:**
 - IP Address/Hostname Discovery List:** A list box containing IP addresses: 10.2.8.45, 10.2.8.46, 10.2.8.48, and 10.2.8.49.
 - SNMP Credentials:** A list box with various SNMP-related credentials, including 'Cisco SNMPv2 - Example' and 'Cisco SNMPv3 - Example'.
 - Other Credentials:** A list box with various other credentials, including 'Cisco: ACI Sample Credential 1' and 'Cisco: ACI Sample Credential 2'.
- Detection and Scanning:**
 - Initial Scan Level:** Set to '[System Default (recommended)]'.
 - Scan Throttle:** Set to '[System Default (recommended)]'.
 - Port Scan All IPs:** Set to '[System Default (recommended)]'.
 - Port Scan Timeout:** Set to '[System Default (recommended)]'.
 - Detection Method & Port:** A list box showing various protocols and ports, including 'UDP: 161 SNMP', 'TCP: 1 - tcpmux', 'TCP: 2 - compressnet', 'TCP: 3 - compressnet', 'TCP: 5 - rje', 'TCP: 7 - echo', 'TCP: 9 - discard', 'TCP: 11 - systat', 'TCP: 13 - daytime', 'TCP: 15 - netstat', and 'TCP: 17 - qotd'.
 - Interface Inventory Timeout (ms):** Set to 600000.
 - Maximum Allowed Interfaces:** Set to 10000.
 - Bypass Interface Inventory:** A checkbox that is currently unchecked.
- Basic Settings:**
 - Discover Non-SNMP:** A checked checkbox.
 - Model Devices:** A checked checkbox.
 - DHCP:** An unchecked checkbox.
 - Duplication Protection:** A checked checkbox.
 - Collection Server PID:** Set to 3.
 - Organization:** Set to '[Docker 45]'.
 - Add Devices to Device Group(s):** A list box showing 'None' and 'Servers'.
 - Apply Device Template:** A dropdown menu set to '[Choose a Template]'.

At the bottom, there are buttons for 'Save', 'Save As', and 'Log All'.

- **Name.** Type a name for your discovery session.
- **IP Address/Hostname Discovery List.** Type the IP addresses for all of the Docker hosts in the swarm that you want to discover.

NOTE: Swarms are created only when the swarm leader is discovered.

- **Other Credentials.** Select the [Basic/Snippet or SSH/Key credential\(s\)](#) you created for Docker.
- **Discover Non-SNMP.** Select this checkbox.
- **Model Devices.** Select this checkbox.

3. Optionally, you can enter values in the other fields on this page. For more information about the other fields on this page, see the **Discovery & Credentials** manual.
4. Click the **[Save]** button to save the discovery session, and then close the **Discovery Session Editor** window.
5. The discovery session you created displays at the top of the **Discovery Control Panel** page. Click its lightning-bolt icon (⚡) to run the discovery session.
6. The **Discovery Session** window appears. When a root device is discovered, click its device icon (🖥️) to view the **Device Properties** page for that device.

Manually Aligning Dynamic Applications

To verify that the ScienceLogic platform has automatically aligned the correct Dynamic Applications during discovery:

1. From the **Device Properties** page (Registry > Devices > wrench icon (🔧)) for the Docker root device, click the **[Collections]** tab. The **Dynamic Application Collections** page appears.
2. The following Dynamic Applications should appear in the list of aligned Dynamic Applications:
 - For Docker Hosts:
 - Docker: Container Discovery
 - Docker: Containers Performance
 - Docker: Host Configuration
 - Docker: Host Performance
 - Docker: Host Reclassification
 - Docker: Image Configuration
 - Docker: Image Performance
 - Docker: Network Configuration
 - Docker: Swarm Cluster Discovery
 - For Docker Swarms:
 - Docker: Stack Discovery
 - Docker: Swarm Configuration
 - Docker: Swarm Performance
 - Docker: Swarm Service Discovery

NOTE: It can take several minutes after discovery for Dynamic Applications to display on the **Dynamic Application Collections** page. If the listed Dynamic Applications do not display on this page, try clicking the **[Reset]** button.

If the Dynamic Applications have not been automatically aligned, you can align them manually. To do so, perform the following steps:

1. Go to the **Device Properties** page (Registry > Devices > wrench icon()) for the Docker root device and click the **[Collections]** tab. The **Dynamic Application Collections** page appears.
2. On the **Dynamic Application Collections** page, click the **[Action]** button and then select *Add Dynamic Application* from the menu. The **Dynamic Application Alignment** page appears.

3. In the **Dynamic Applications** field, select a Dynamic Application to align.
4. In the **Credentials** field, select the **Basic/Snippet credential** you created for Docker.
5. Click the **[Save]** button.
6. Repeat steps 2-5 as needed to align any additional Dynamic Applications.

Viewing Docker Component Devices

In addition to the **Device Manager** page (Registry > Devices > Device Manager), you can view the Docker platform and all of its component devices in the following places in the user interface:

- The **Device View** modal page (Registry > Devices > Device Manager > graph icon > Topology) displays a map of a particular device and all of the devices with which it has parent-child relationships. Double-clicking any of the devices listed reloads the page to make the selected device the primary device:

- The **Device Components** page (Registry > Devices > Device Components) displays a list of all root devices and component devices discovered by the ScienceLogic platform in an indented view, so you can easily view the hierarchy and relationships between child devices, parent devices, and root devices. To view the component devices associated with Docker, find the Docker Host or Docker Swarm device and click its plus icon (+):

	Device Name	IP Address	Device Category	Device Class Sub-class	DID	Organization	Current State	Collection Group	Collection State

- The **Component Map** page (Views > Device Maps > Components) allows you to view devices by root node and view the relationships between root nodes, parent components, and child components in a map. This makes it easy to visualize and manage root nodes and their components. The ScienceLogic platform automatically updates the **Device Component Map** as new component devices are discovered. The platform also updates each map with the latest status and event information. To view the map for Docker, go to the **Device Component Map** page (Views > Device Maps > Components) and select the map from the list in the left NavBar. To learn more about the **Device Component Map** page, see the **Views** manual.

Relationships Between Component Devices

In addition to parent/child relationships between component devices, the ScienceLogic platform also creates relationships between the following component devices:

- Swarms and Nodes
- Services and Containers

You can also use the *Docker* PowerPack in conjunction with the *Kubernetes* PowerPack when monitoring Kubernetes systems. When you do so, the platform creates relationships between Docker Swarms and Containers and their underlying Kubernetes Nodes.

Docker Dashboards

Overview

The following sections describe the device dashboards that are included in the *Docker PowerPack*:

<i>Device Dashboards</i>	18
<i>Docker: Container</i>	19
<i>Docker: Host</i>	20
<i>Docker: Service</i>	21
<i>Docker: Stack</i>	22
<i>Docker: Swarm</i>	23

Device Dashboards

The *Docker PowerPack* includes device dashboards that provide summary information for Docker component devices. Each of the device dashboards in the *Docker PowerPack* is set as the default device dashboard for the equivalent device class.

Docker: Container

The Docker: Container device dashboard displays the following information:

- Events and tickets for the device
- Memory and CPU utilization over a specified period of time
- Page faults over a specified period of time
- Throttled periods over a specified period of time
- Top interfaces with the highest percentage of errors and dropped packets over a specified period of time
- Top interfaces by total packets received over a specified period of time
- Number of input and output operations over a specified period of time

Docker: Host

The Docker: Host device dashboard displays the following information:

- Containers running and stopped over a specified period of time, as well as average container uptime
- Total CPU utilization and memory across all containers over a specified period of time
- Events and tickets for the device
- Top 10 images by CPU and memory utilization over a specified period of time
- Top 10 images by bandwidth utilization over a specified period of time
- Top 10 images by running containers over a specified period of time

Docker: Service

The Docker: Service device dashboard displays the following information:

- Containers running and stopped over a specified period of time, as well as average container uptime
- Service CPU utilization over a specified period of time
- Events and tickets for the device
- Throttled periods over a specified period of time
- Top service page faults over a specified period of time
- Total service input and output requests over a specified period of time

Docker: Stack

The Docker: Stack device dashboard displays the following information:

- Containers running, stopped, and paused over a specified period of time, as well as average container uptime
- Stack CPU utilization over a specified period of time
- Throttled periods over a specified period of time
- Top 5 services in the stack over a specified period of time, based on the number of major page faults
- Top 5 services in the stack over a specified period of time, based on the number of page faults
- Top 5 services in the stack over a specified period of time, based on CPU utilization
- Top 5 services in the stack over a specified period of time, based on the number of running containers

Docker: Swarm

The Docker: Swarm device dashboard displays the following information:

- Containers running, stopped, and paused over a specified period of time, as well as average container uptime
- Number of stacks, services, images, total nodes, and available nodes over a specified period of time
- Top 5 stacks in the swarm over a specified period of time, based on CPU utilization
- Top 5 services in the swarm over a specified period of time, based on CPU utilization
- Top 5 services in the swarm over a specified period of time, based on the number of major page faults and total page faults
- Overall swarm CPU utilization
- Overall swarm memory utilization
- Overall swarm input and output
