Chapter

1

Introduction

Overview

This manual describes how to monitor IBM Db2 databases in SL1 using the *IBM: Db2PowerPack*.

The following sections provide an overview of IBM Db2 and the *IBM: Db2PowerPack*:

| | |
|---|---|
| <i>What is IBM Db2?</i> | 3 |
| <i>What Does the IBM: Db2PowerPack Monitor?</i> | 4 |
| <i>Installing the IBM: Db2 PowerPack</i> | 4 |

NOTE: ScienceLogic provides this documentation for the convenience of ScienceLogic customers. Some of the configuration information contained herein pertains to third-party vendor software that is subject to change without notice to ScienceLogic. ScienceLogic makes every attempt to maintain accurate technical information and cannot be held responsible for defects or changes in third-party vendor software. There is no written or implied guarantee that information contained herein will work for all third-party variants. See the End User License Agreement (EULA) for more information.

What is IBM Db2?

IBM Db2 is a family of data management products that includes database servers. The IBM Db2 Database is a relational database that delivers advanced data management and analytics capabilities for transactional workloads.

What Does the IBM: Db2PowerPack Monitor?

To monitor IBM Db2 databases using SL1, you must install the *IBM: Db2 PowerPack*. This PowerPack enables you to discover, model, and collect data about IBM Db2 databases.

The *IBM: Db2 PowerPack* includes:

- Example credentials you can use as templates to create credentials to discover and connect to the IBM Db2 databases and instances you want to monitor
- Dynamic Applications to discover, model, and monitor performance metrics and collect configuration data for IBM Db2 databases
- Event Policies and corresponding alerts that are triggered when IBM Db2 databases meet certain status criteria
- A Run Book Action and Run Book Automation policy for aligning Dynamic Applications
- A device dashboard to display summary information about Db2 instances

Installing the IBM: Db2 PowerPack

Before completing the steps in this manual, you must import and install the latest version of the *IBM: Db2PowerPack*.

TIP: By default, installing a new version of a PowerPack overwrites all content from a previous version of that PowerPack that has already been installed on the target system. You can use the **Enable Selective PowerPack Field Protection** setting in the **Behavior Settings** page (System > Settings > Behavior) to prevent new PowerPacks from overwriting local changes for some commonly customized fields. (For more information, see the **System Administration** manual.)

To download and install a PowerPack:

1. Download the PowerPack from the [ScienceLogic Support Site](#).
2. Go to the **PowerPack Manager** page (System > Manage > PowerPacks).
3. In the **PowerPack Manager** page, click the **[Actions]** button, then select *Import PowerPack*.
4. The **Import PowerPack** dialog box appears:

5. Click the **[Browse]** button and navigate to the PowerPack file.
6. When the **PowerPack Installer** modal appears, click the **[Install]** button to install the PowerPack.

NOTE: If you exit the **PowerPack Installer** modal without installing the imported PowerPack, the imported PowerPack will not appear in the **PowerPack Manager** page. However, the imported PowerPack will appear in the **Imported PowerPacks** modal. This page appears when you click the **[Actions]** menu and select *Install PowerPack*.

Configuring IBM Db2 Monitoring

Overview

Use the following menu options to navigate the SL1 user interface:

- To view a pop-out list of menu options, click the menu icon (.
- To view a page containing all the menu options, click the Advanced menu icon (.

The following sections describe how to configure and discover IBM Db2 databases for monitoring by SL1 using the *IBM: Db2 PowerPack*:

| | |
|--|-----------|
| Prerequisites for Monitoring IBM Db2 | 7 |
| <i>Prerequisites for Linux/Unix Users</i> | 7 |
| <i>Prerequisites for Windows Users</i> | 8 |
| Creating Credentials for IBM Db2 | 10 |
| <i>Creating an SSH/Key Credential (Linux and Unix Users)</i> | 10 |
| <i>Creating a PowerShell Credential (Windows Users)</i> | 12 |
| <i>Creating a SOAP/XML Credential (Linux and Unix Users)</i> | 13 |
| <i>Creating a SOAP/XML Credential (Windows Users)</i> | 15 |
| <i>Updating the Database Credential</i> | 17 |
| Discovering IBM Db2 Component Devices | 18 |
| <i>Discovering IBM Db2 Component Devices in the SL1 Classic User Interface</i> | 20 |
| Verifying Discovery and Dynamic Application Alignment | 21 |
| Viewing IBM Db2 Component Devices | 25 |

Prerequisites for Monitoring IBM Db2

To configure the SL1 system to monitor IBM Db2 databases using the *IBM: Db2 PowerPack*, you must first perform the following prerequisites based on your operating system:

Prerequisites for Linux/Unix Users

1. Create a shell session and SSH into the Db2 database you want to monitor.
2. Create a new group to monitor by entering the following command:

```
sudo groupadd <group_name>
```

3. Create a new user for the group you created by entering the following command:

```
sudo useradd -u <user_id> -g <group_name> -m -d /home/<user_name> <user_name>
```

4. Set a password for the user you created by entering the following command:

```
sudo passwd <user_name>
```

5. Log in with the instance admin user. For example: `su - db2inst1`

6. Run the following commands:

```
db2 update database manager configuration using SYSMON_GROUP <group_name>
```

```
db2stop
```

```
db2start
```

7. Connect to your database with the following command:

```
db2 connect to <db_name>
```

8. Run the following command to grant the DATAACCESS privilege to the user:

```
db2 "grant DATAACCESS ON DATABASE TO USER <user_name>"
```

9. Verify permissions with the following commands:

```
db2 connect to <db_name> user <user_name> using <user_password>
```

```
db2 "select SUBSTR(AUTHORITY,1,30), D_USER, D_GROUP, D_PUBLIC, ROLE_USER, ROLE_GROUP, ROLE_PUBLIC, D_ROLE from table (sysproc.auth_list_authorities_for_authid (CURRENT_USER, 'U'))"
```

| |
|--|
| NOTE: Repeat steps 4 - 7 for each Db2 instance. |
|--|

| | D_USER | D_GROUP | D_PUBLIC | ROLE_USER | ROLE_GROUP | ROLE_PUBLIC | D_ROLE |
|---------------------------|--------|---------|----------|-----------|------------|-------------|--------|
| SYSADM | * | N | * | * | * | * | * |
| DBADM | N | N | N | N | N | N | * |
| CREATETAB | N | N | Y | N | N | N | * |
| BINDADD | N | N | Y | N | N | N | * |
| CONNECT | N | Y | Y | N | N | N | * |
| CREATE_NOT_FENCED_ROUTINE | N | N | N | N | N | N | * |
| SYSCTRL | * | N | * | * | * | * | * |
| SYMAINT | * | N | * | * | * | * | * |
| IMPLICIT_SCHEMA | N | N | Y | N | N | N | * |
| LOAD | N | N | N | N | N | N | * |
| CREATE_EXTERNAL_ROUTINE | N | N | N | N | N | N | * |
| QUIESCE_CONNECT | N | N | N | N | N | N | * |
| SECADM | N | N | N | N | N | N | * |
| SYSMON | * | Y | * | * | * | * | * |
| SQLADM | N | N | N | N | N | N | * |
| WLMADM | N | N | N | N | N | N | * |
| EXPLAIN | N | N | N | N | N | N | * |
| DATAACCESS | Y | N | N | N | N | N | * |
| ACCESSCTRL | N | N | N | N | N | N | * |

NOTE: The user you create will likely need to use KornShell (for Unix systems) or Bash (for Linux systems).

If you are unsure of the shell directory, you can use the command `which ksh` to determine the KornShell directory, or `which bash` to determine the Bash directory.

After you have determined shell directory, run the following commands, replacing `<shell_directory>` with the KornShell or Bash directory:

```
sudo useradd -u <user_id> -g <group_name> -s <shell_directory> -m -d
/home/<user_name> <user_name>
```

You **should not** use Shell (sh) as the shell for the user. Using Shell for the user shell could result in shell-related errors appearing in the Device Log.

Prerequisites for Windows Users

NOTE: Before performing the steps for the Windows prerequisites, ensure that you have followed the steps in the *Configuring Windows Servers for Monitoring with PowerShell* section of the **Monitoring Windows Systems with PowerShell** manual.

Windows users will need to create a local user and group for the Db2 database. If you have already done so, proceed to [adding the group to the instance database manager](#). To create the user and group, perform the following steps:

1. Click **[Start]** and select **Run**.
2. In the **Run** window, enter `lusrmgr.msc` and click **[OK]**.
3. In the **Local Users and Groups** pane, select the **Users** folder.

4. Click the **Action** menu and select *New User...* Enter the new user's information in the **New User** window and click **[Create]**.
5. In the **Local Users and Groups** pane, select the **Groups** folder.
6. Click the **Action** menu and select *New Group...* Enter the new group's information in the **New Group** window and click **[Create]**.
7. To add the new user to the group, double-click on the group name.
8. Click the **[Add...]** button under the **Members** window and enter the username. Click **[OK]**.

NOTE: You may need to add the user to the Administrators group in order to use PowerShell remoting if you don't have a PowerShell group/policy in place for non-adminstrative users.

Next, you will need to add the group you created to the instance database manager:

1. Log in to the Db2 database as the instance admin user.
2. Open the Db2 admin shell.
3. Run the following commands:

```
db2 update database manager configuration using SYSMON_GROUP <group_name>
db2stop
db2start
```

Next, you will grant the DATAACCESS privilege to the new user:

1. Log in to the Db2 database as the instance admin user.
2. Open the Db2 admin shell.
3. Run the following commands:

```
db2 connect to <database>
db2 "grant DATAACCESS on database to user <user_name>"
```

NOTE: You will need to grant this access to each database.

NOTE: Perform the steps to add the group to the instance database manager and to grant the DATAACCESS privilege for each Db2 instance that you will monitor.

Creating Credentials for IBM Db2

To monitor Db2 databases using SL1, you must create two credentials. These credentials enable SL1 to collect data from your Db2 databases. The types of credentials that are required for monitoring depend on the type of database being monitored:

- Linux and Unix users must use an [SSH/Key credential](#) and a [SOAP/XML credential](#)
- Windows users must use a [PowerShell credential](#) and a [SOAP/XML credential](#)

In addition, if the password has changed for the account with access to the Db2 database, you will need to update the corresponding [Database credential](#).

Creating an SSH/Key Credential (Linux and Unix Users)

Linux and Unix users must create an SSH/Key credential.

To create an SSH/Key credential :

1. Go to the **Credential Management** page (System > Manage > Credentials).
2. Click the wrench icon () for the "DB2 SSH Example" credential. The **Credential Editor** modal page appears:

The screenshot shows a window titled "Credential Editor [103]" with a sub-header "Edit SSH/Key Credential #103". Inside, there are "New" and "Reset" buttons. The "Basic Settings" section contains the following fields:

- Credential Name:** DB2 SSH Example
- Hostname/IP:** %D
- Port:** 22
- Timeout(ms):** 0
- Username:** USER_NAME_GOES_HERE
- Password:** Masked with asterisks
- Private Key (PEM Format):** A large empty text area.

At the bottom, there are "Save" and "Save As" buttons.

3. Supply values in the following fields:

- **Credential Name.** Type a new name for the credential.
- **Hostname/IP.** Type the IP address or hostname of the Db2 database you want to monitor.
- **Port.** Keep the default setting.
- **Timeout(ms).** Keep the default setting.
- **Username.** Type the username for a user with access to the Db2 database.
- **Password.** Type the password for the account with access to the Db2 database.
- **Private Key (PEM Format).** Optional. Use if required for SSH authentication.

NOTE: If your SSH access to the Db2 database allows you to only use a PEM key and prevents you from using a username and password, enter a PEM key in the SSH/Key credential and then include a username and password in the SOAP/XML credential instead.

4. Click the **[Save As]** button.
5. When the confirmation message appears, click **[OK]**.

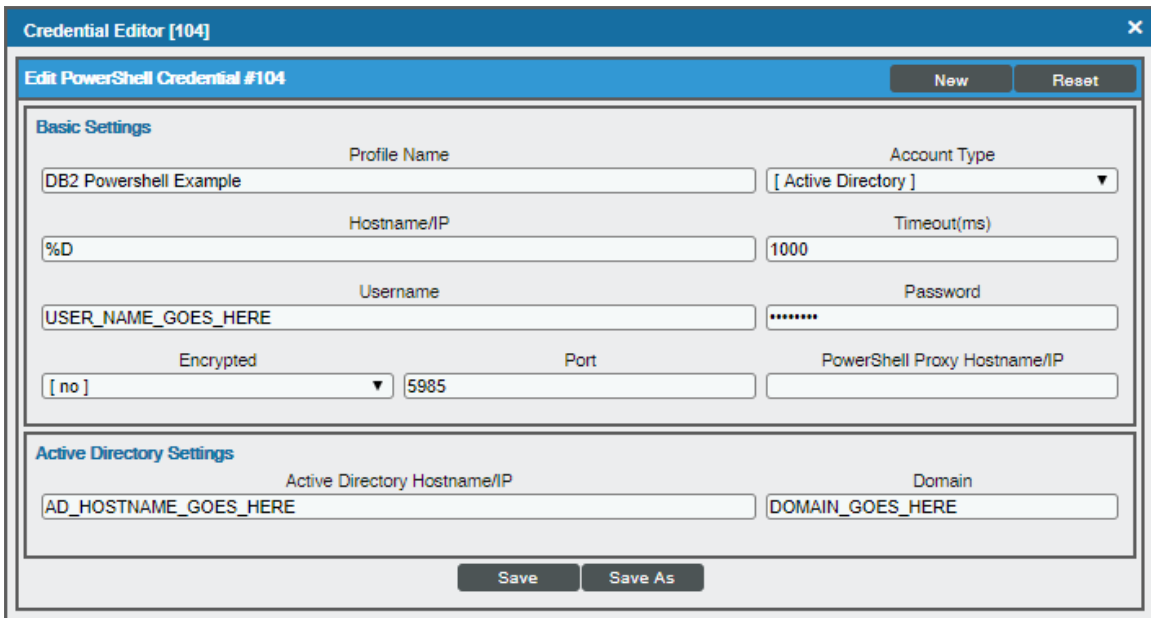

NOTE: The credential ID will appear at the top of the window after it has been saved. Take note of the ID as you will need it when creating the SOAP/XML credential.

Creating a PowerShell Credential (Windows Users)

Windows users must create a PowerShell credential.

To create a PowerShell credential:

1. Go to the **Credential Management** page (System > Manage > Credentials).
2. Click the wrench icon (🔧) for the "DB2 Powershell Example" credential. The **Credential Editor** modal page appears:

The screenshot shows the "Credential Editor [104]" window. The title bar is blue with a close button (X) on the right. Below the title bar is a header bar with the text "Edit PowerShell Credential #104" and two buttons: "New" and "Reset". The main content area is divided into two sections: "Basic Settings" and "Active Directory Settings".

Basic Settings:

- Profile Name: DB2 Powershell Example
- Account Type: [Active Directory]
- Hostname/IP: %D
- Timeout(ms): 1000
- Username: USER_NAME_GOES_HERE
- Password: [masked with dots]
- Encrypted: [no]
- Port: 5985
- PowerShell Proxy Hostname/IP: [empty]

Active Directory Settings:

- Active Directory Hostname/IP: AD_HOSTNAME_GOES_HERE
- Domain: DOMAIN_GOES_HERE

At the bottom of the window are two buttons: "Save" and "Save As".

3. Supply values in the following fields:

- **Profile Name.** Type a new name for the credential. Can be any combination of alphanumeric characters.
- **Account Type.** Select the type of authentication for the username and password in this credential. Choices are:
 - *Active Directory.* On the device, Active Directory will authenticate the username and password in this credential.
 - *Local.* Local security on the device will authenticate the username and password in this credential.
- **Hostname/IP.** Type the IP address of the Db2 database from which you want to retrieve data, or enter the variable **%D**.
- **Timeout (ms).** Type the time, in milliseconds, after which SL1 will stop trying to collect data from the authenticating server. For collection to be successful, SL1 must connect to the authenticating server, execute the PowerShell command, and receive a response within the amount of time specified in this field.
- **Username.** Type the username for a user with access to the Db2 database to be monitored.
- **Password.** Type the password for the user account with access to the Db2 database to be monitored.
- **Encrypted.** Select whether SL1 will communicate with the device using an encrypted connection. Choices are:
 - *yes.* When communicating with the Windows server, SL1 will use a local user account with authentication of type "Basic Auth". You must then use HTTPS and can use a Microsoft Certificate or a self-signed certificate.
 - *no.* When communicating with the Windows server, SL1 will not encrypt the connection.
- **Port.** Leave as default value.
- **PowerShell Proxy Hostname/IP.** Leave this field blank.

4. Click the **[Save As]** button.

Creating a SOAP/XML Credential (Linux and Unix Users)

After configuring the SSH/Key credential, you must then create a SOAP/XML credential.

To create the SOAP/XML credential:

1. Go to the **Credential Management** page (System > Manage > Credentials).

- Click the wrench icon (🔧) for the "DB2 Soap with SSH Example" credential for Linux/Unix users. The **Credential Editor** modal page appears:

The screenshot shows the 'Credential Editor' window for 'Edit SOAP/XML Credential #96'. The window is divided into several sections:

- Basic Settings:** Profile Name (DB2 Soap with SSH Example), Content Encoding ([text/xml]), Method ([POST]), HTTP Version ([HTTP/1.1]), URL (http://%D), HTTP Auth User ([DATABASE_USER]), HTTP Auth Password (masked), and Timeout (2 seconds).
- Proxy Settings:** Hostname/IP, Port (0), and User.
- CURL Options:** A list of options including CAINFO, CAPATH, CLOSEPOLICY, CONNECTTIMEOUT, COOKIE, COOKIEFILE, COOKIEJAR, COOKIELIST, CRLF, CUSTOMREQUEST, and DNSCACHETIMEOUT.
- Soap Options:** Embedded Password [%P] and four Embed Value [%1] through [%4] fields.
- HTTP Headers:** A list of headers including base_db2_path: <DB2 Installation Path>, instance: <Instance Name>: <Port>, and ssh: <SSH Credential ID>.

Buttons for 'New', 'Reset', 'Save', and 'Save As' are visible at the bottom of the window.

- Update the values in the following fields:

Basic Settings

- **Profile Name.** Type a new name for the credential.
- **URL.** Leave the default value of https://%D.
- **HTTP Auth User.** If your SSH access to the Db2 database allows you to only use a PEM key and prevents you from using a username and password, type the username for a user with access to the Db2 database in this field. Otherwise, if you are inserting the database username and password in the SSH/Key credential, leave this field blank.
- **HTTP Auth Password.** If your SSH access to the Db2 database allows you to only use a PEM key and prevents you from using a username and password, type the password for the account with access to the Db2 database in this field. Otherwise, if you are inserting the database username and password in the SSH/Key credential, leave this field blank.

NOTE: If the **HTTP Auth User** and **HTTP Auth Password** fields are blank, then the Dynamic Applications in the *IBM: Db2 PowerPack* will use the credentials provided in the SSH/Key credential.

HTTP Headers

- **HTTP Headers.** Add the following headers by clicking + **Add a header**:
 - `base_db2_path:<DB2 Installation Path>`. For example: `base_db2_path:/opt/ibm/db2/V11.5`
 - `instance:<Instance Name>:<Port>` For example: `instance:db2inst1:50000`
 - `instance:<Instance Name2>:<Port2>` For example: `instance:db2inst2:50000`
 - `ssh:<SSH Credential ID>`

NOTE: In versions of the PowerPack prior to version 103, headers required the "<DB_NAME>" value. This value is no longer needed and can be deleted after you upgrade the PowerPack.

NOTE: You can create a header for each Db2 instance you have.

NOTE: During the discovery process, these headers will either find an existing Database credential that matches the user, password, port, and default database, or it will create a new Database credential.

NOTE: By default, the SOAP/XML credential deletes any white space before and after the colon (:) in the credential headers. If you want to include paths with white spaces in the credential, surround the path with double quotes after the colon. For example: `<base_db2_path:"/opt/folder name/program files">`

4. Click the **[Save As]** button.

Creating a SOAP/XML Credential (Windows Users)

After configuring the PowerShell credential, you must then create a SOAP/XML credential.

To create the SOAP/XML credential:

1. Go to the **Credential Management** page (System > Manage > Credentials).

- Click the wrench icon (🔧) for the "DB2 Soap with PowerShell Example" credential for Windows users. The **Credential Editor** modal page appears:

The screenshot shows the 'Credential Editor [99]' window. The title bar indicates it is editing a 'SOAP/XML Credential #99'. The interface is divided into several sections:

- Basic Settings:** Profile Name (DB2 Soap with PowerShell Example), Content Encoding ([text/xml]), Method ([POST]), HTTP Version ([HTTP/1.1]), URL (http(s)://Host:Port/Path | %D = Aligned Device Address | %N = Aligned Device Host Name), HTTP Auth User ([DATABASE_USER]), HTTP Auth Password (masked), and Timeout (seconds) (2).
- Proxy Settings:** Hostname/IP, Port (0), and User.
- CURL Options:** A list of options including CAINFO, CAPATH, CLOSEPOLICY, CONNECTTIMEOUT, COOKIE, COOKIEFILE, COOKIEJAR, COOKIELIST, CRLF, CUSTOMREQUEST, and DNSCACHETIMEOUT.
- Soap Options:** Embedded Password [%P] and four Embed Value [%1] through [%4] fields.
- HTTP Headers:** A section with a '+ Add a header' button and two existing headers: 'instance:<Instance Name>:<Port>' and 'powershell:<PowerShell Credential ID>'.

Buttons for 'New', 'Reset', 'Save', and 'Save As' are visible at the bottom.

- Update the values in the following fields:

Basic Settings

- **Profile Name.** Type a new name for the credential.
- **URL.** Leave the default value of https://%D.

HTTP Headers

- **HTTP Headers.** Add the following headers by clicking + **Add a header**:
 - `instance:<Instance Name>:<Port>` For example: `instance:db2inst1:50000`
 - `instance:<Instance Name2>:<Port2>` For example: `instance:db2inst2:50000`
 - `powershell:<PowerShell Credential ID>`

NOTE: You can create a header for each Db2 instance you have.

NOTE: During the discovery process, these headers will either find an existing Database credential that matches the user, password, port, and default database, or it will create a Database credential.

NOTE: By default, the SOAP/XML credential deletes any white space before and after the colon (:) in the credential headers. If you want to include paths with white spaces in the credential, surround the path with double quotes after the colon. For example: `<base_db2_path:"/opt/folder name/program files">`

4. Click the **[Save As]** button.

Updating the Database Credential

If the password has changed for the account with access to the Db2 database, you must also update the corresponding Database credential in SL1. Otherwise, you can skip this section.

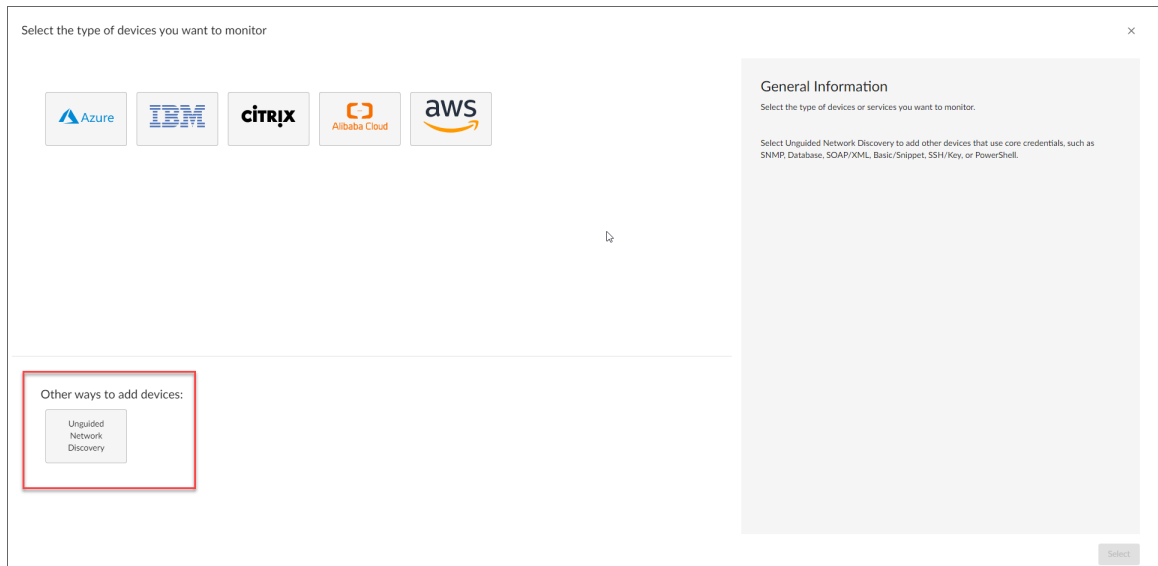

To update the Database credential:

1. Go to the **Credential Management** page (System > Manage > Credentials).
2. In the **Type** column filter, type "Database". This filters the list so that only Database credentials appear on the page.
3. Search for and locate the credential that includes the name and port of the database with the updated password, then click the credential's wrench icon () .
4. On the **Credential Editor** modal page that appears, type the new password in the Password field.
5. Click **[Save]**.

Discovering IBM Db2 Component Devices

To discover an IBM Db2 database, perform the following steps:

1. On the **Devices** page (🖨️) or the **Discovery Sessions** page (Devices > Discovery Sessions), click the **[Add Devices]** button. The **Select** page appears:

2. Click the **[Unguided Network Discovery]** button. Additional information about the requirements for discovery appears in the **General Information** pane to the right.
3. Click **[Select]**. The **Add Devices** page appears.
4. Complete the following fields:
 - **Name**. Type a unique name for this discovery session. This name is displayed in the list of discovery sessions on the **[Discovery Sessions]** tab.
 - **Description**. Optional. Type a short description of the discovery session. You can use the text in this description to search for the discovery session on the **[Discovery Sessions]** tab.
 - **Select the organization to add discovered devices to**. Select the name of the organization to which you want to add the discovered devices
5. Click **[Next]**. The **Credentials** page of the **Add Devices** wizard appears:

6. On the **Credentials** page, locate and select the SOAP/XML *credential* you created for the Db2 database.
7. Click **[Next]**. The **Discovery Session Details** page of the **Add Devices** wizard appears:

8. Complete the following fields:
 - **List of IPs/Hostnames.** Type the IP address of Type the IP address for the Db2 database.
 - **Which collector will monitor these devices?** Required. Select an existing collector to monitor the discovered devices.
 - **Run after save.** Select this option to run this discovery session as soon as you save the session.

In the **Advanced options** section, click the down arrow icon (▼) to complete the following fields:

- **Discover Non-SNMP.** Enable this setting.
 - **Model Devices.** Enable this setting.
9. Click **[Save and Run]** if you enabled the **Run after save** setting, or **[Save and Close]** to save the discovery session. The **Discovery Sessions** page (Devices > Discovery Sessions) displays the new discovery session.
 10. If you selected the **Run after save** option on this page, the discovery session runs, and the **Discovery Logs** page displays any relevant log messages. If the discovery session locates and adds any devices, the **Discovery Logs** page includes a link to the **Device Investigator** page for the discovered device.

Discovering IBM Db2 Component Devices in the SL1 Classic User Interface

To discover an IBM Db2 database:

1. Go to the **Discovery Control Panel** page (System > Manage > Classic Discovery).
2. In the **Discovery Control Panel**, click the **[Create]** button. The **Discovery Session Editor** page appears.

The screenshot shows the 'Discovery Session Editor | Editing Session [3]' interface. It is divided into several sections:

- Identification Information:** Includes a 'Name' field with the value 'db2 - 67' and an empty 'Description' field.
- IP and Credentials:** Contains an 'IP Address/Hostname Discovery List' with the value '10.2.21.67', an 'Upload File' section with a 'Browse...' button, and two credential lists: 'SNMP Credentials' (with a list of protocols like Cisco SNMPv2, etc.) and 'Other Credentials' (with a list of device types like Cisco CE Series, etc.).
- Detection and Scanning:** Features several dropdown menus for 'Initial Scan Level', 'Scan Throttle', 'Port Scan All IPs', and 'Port Scan Timeout', all set to '[System Default (recommended)]'. It also includes a 'Detection Method & Port' list with options like 'UDP: 161 SNMP', 'TCP: 1 - topmux', etc. Below this are input fields for 'Interface Inventory Timeout (ms)' (600000) and 'Maximum Allowed Interfaces' (10000), and a 'Bypass Interface Inventory' checkbox.
- Basic Settings:** Includes checkboxes for 'Discover Non-SNMP' (checked), 'Model Devices' (checked), and 'DHCP' (unchecked). It also has input fields for 'Device Model Cache TTL (h)' (2) and 'Collection Server PID: 3'. A dropdown for 'Organization' is set to '[DB2 Instances]'. There is an 'Add Devices to Device Group(s)' section with a list containing 'None', 'LayerX Appliances', and 'Servers'. At the bottom, there is an 'Apply Device Template' dropdown set to '[Choose a Template]'.

At the bottom of the interface, there are 'Save' and 'Save As' buttons, and a 'Log All' checkbox which is checked.

3. In the **Discovery Session Editor** page, complete the following fields:
 - **Name.** Type a name for the discovery session.
 - **IP Address/Hostname Discovery List.** Type the IP address for the Db2 database.

- **Other Credentials.** Select the SOAP/XML credential you created for the Db2 database.
 - **Discover Non-SNMP.** Select this checkbox.
 - **Model Devices.** Select this checkbox.
4. Optionally, you can enter values in the other fields on this page. For more information about the other fields on this page, see the **Discovery & Credentials** manual.
 5. Click the **[Save]** button to save the discovery session and then close the **Discovery Session Editor** window.
 6. The discovery session you created appears at the top of the **Discovery Control Panel** page. Click its lightning-bolt icon () to run the discovery session.
 7. The **Discovery Session** window appears. When the cluster root device(s) are discovered, click the device icon () to view the **Device Properties** page for each device.

Verifying Discovery and Dynamic Application Alignment

To verify that SL1 has automatically aligned the correct Dynamic Applications during discovery:

1. After the discovery session has completed, go to the **Devices** page—or the **Device Manager** (Registry > Devices > Device Manager) page in the SL1 classic user interface—and find the device(s) you discovered. When you have located the device, click on its name or click on its edit icon () if you are in the SL1 classic user interface.
2. Click the **[Collections]** tab.
3. All applicable Dynamic Applications for the Db2 devices are automatically aligned during discovery.

NOTE: It can take several minutes after the discovery session has completed for Dynamic Applications to appear in the **Dynamic Application Collections** page.

To verify alignment of the IBM Db2 Dynamic Applications:

1. After discovery has completed, go to the **Discovery Logs** page (Devices > Discovery Sessions > click the Actions button  for that session > click Show Logs) and click on the IP address of the device. If you are in the SL1 classic user interface, click the device icon for the IBM Db2 device (). From the **Device Investigator** page for the IBM Db2 device, or the **Device Properties** page if you are in the SL1 classic user interface, click the **[Collections]** tab. The **Dynamic Application Collections** page appears.

NOTE: It can take several minutes after the discovery session has completed for Dynamic Applications to appear in the **Dynamic Application Collections** page.

2. All applicable Dynamic Applications are automatically aligned to the root device and component devices during discovery:

You should see the following Dynamic Application aligned to the root device:

- IBM DB2: Server Discovery

You should see the following Dynamic Application aligned to the Db2 server:

- IBM DB2: Instance Discovery

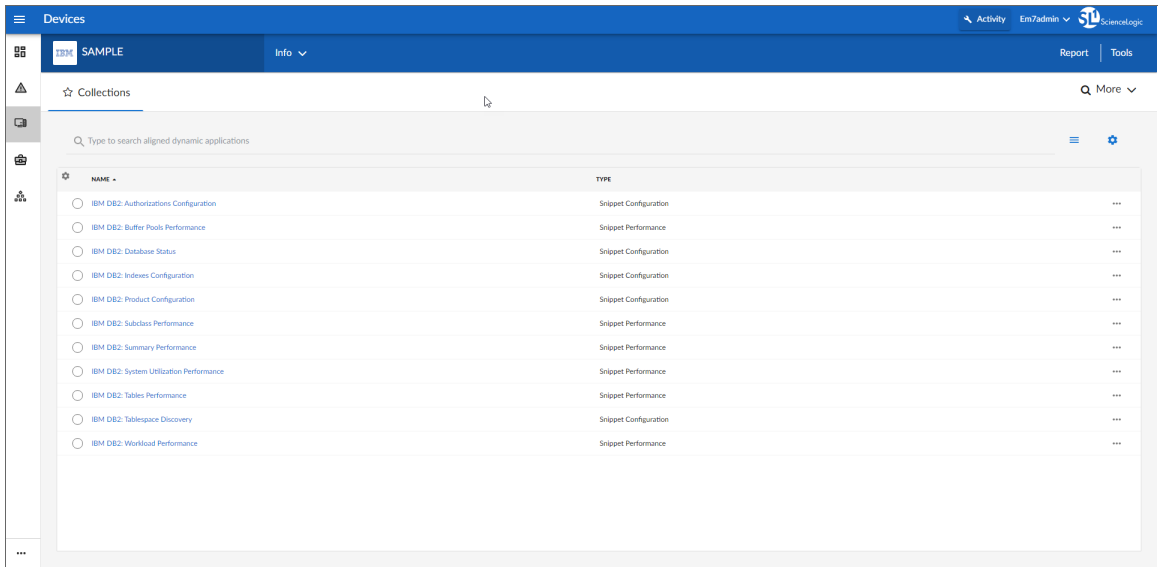

You should see the following Dynamic Application aligned to the Db2 instance:

- IBM DB2: Database Discovery
- IBM DB2: Diagnostics Log Configuration

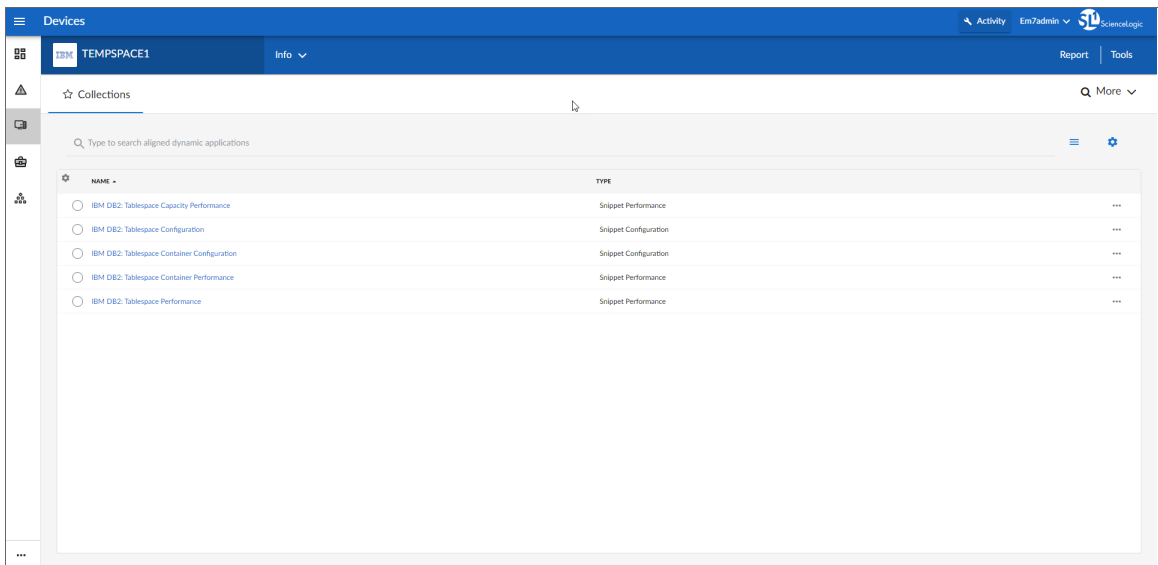

You should see some or all of the following Dynamic Applications aligned to the Db2 database:

- IBM DB2: Authorizations Configuration
- IBM DB2: Buffer Pools Performance
- IBM DB2: Database Status
- IBM DB2: Indexes Configuration
- IBM DB2: Product Configuration
- IBM DB2: Subclass Performance
- IBM DB2: Summary Performance
- IBM DB2: System Utilization Performance
- IBM DB2: Tables Performance
- IBM DB2: Tablespace Discovery
- IBM DB2: Workload Performance

You should see the following Dynamic Applications aligned to the Db2 tablespace:

- IBM DB2: Tablespace Capacity Performance
- IBM DB2: Tablespace Configuration
- IBM DB2: Tablespace Container Configuration
- IBM DB2: Tablespace Container Performance
- IBM DB2: Tablespace Performance

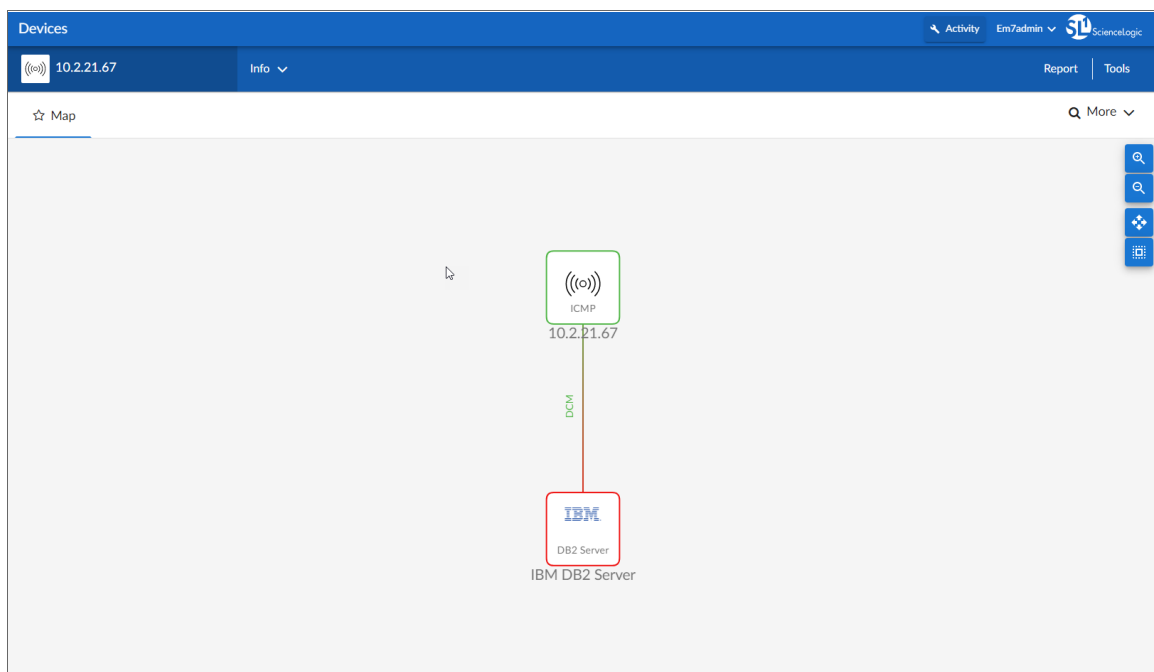

NOTE: The *IBM Db2 PowerPack* uses *db2ilist* to discover all Db2 instances, but the Dynamic Applications will be aligned to only the instances specified in the SOAP/XML credential headers.

Viewing IBM Db2 Component Devices

In addition to the **Device Manager** page (Registry > Devices > Device Manager), you can view the IBM Db2 server and all associated component devices in the following places in the user interface:

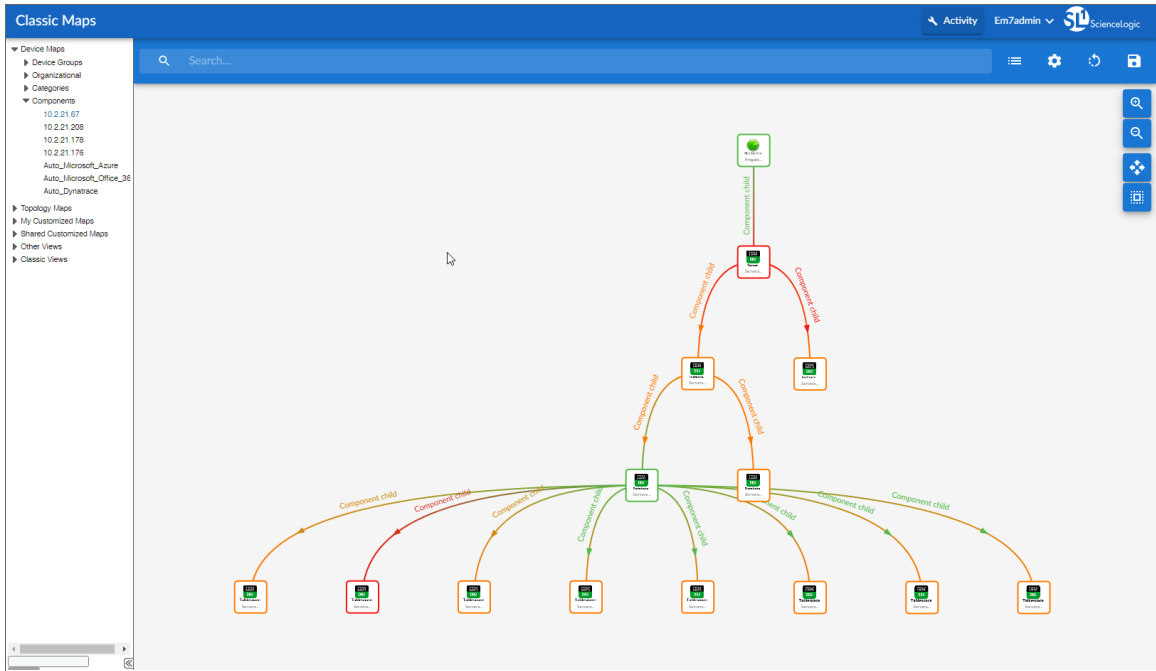

- The **Device Investigator** Map page (click **Map** in the **Device Investigator** page) displays a map of a particular device and all of the devices with which it has parent-child relationships. Double-clicking any of the listed devices reloads the page to make the selected device the primary device:

- The **Device Components** page (Devices > Device Components) displays a list of all root devices and component devices discovered by SL1 in an indented view, so you can easily view the hierarchy and relationships between child devices, parent devices, and root devices. To view the component devices associated with an IBM Db2 server, find the IBM Db2 device and click its plus icon (+):

| Device Name | IP Address | Device Category | Device Class Sub-class | DID | Organization | Current State | Collection Group | Collection State |
|----------------|-------------|-----------------|--------------------------|-----|--------------|---------------|------------------|---------------------------|
| 10.2.21.176 | 10.2.21.176 | Unknown | Ping Generic Linux | 951 | System | Healthy | OCG | User-Disabled |
| 10.2.21.67 | 10.2.21.67 | Pingable | Ping ICMP | 947 | System | Healthy | OCG | User-Disabled |
| IBM Db2 Server | -- | Software | IBM DB2 Server | 948 | System | Healthy | DCG | User-Disabled |
| dbinst1 | -- | Software | IBM DB2 Instance | 949 | System | Healthy | DCG | User-Disabled/Unavailable |
| dbinst2 | -- | Software | IBM DB2 Instance | 950 | System | Healthy | DCG | User-Disabled/Unavailable |

- The **Component Map** page (Classic Maps > Device Maps > Components) allows you to view devices by root node and view the relationships between root nodes, parent components, and child components in a map. This makes it easy to visualize and manage root nodes and their components. SL1 automatically updates the **Component Map** as new component devices are discovered. The platform also updates each map with the latest status and event information. To view the map for an IBM Db2 server, go to the **Component Map** page and select the map from the list in the left NavBar. To learn more about the **Component Map** page, see the **Maps** manual.

IBM Db2 Dashboards

Overview

The following section describes the device dashboard that is included in the *IBM: Db2* PowerPack:

| | |
|--------------------------------|----|
| <i>Device Dashboard</i> | 28 |
| <i>IBM Db2: Database</i> | 29 |

Device Dashboard

The *IBM: Db2* PowerPack includes a device dashboard that provides summary information for Db2 databases. The device dashboard is aligned as the default device dashboard for the Db2 databases.

IBM Db2: Database

The IBM Db2: Database device dashboard displays the following information:

- Six gauges that display the following metrics:
 - I/O Wait Time
 - Compile Wait Time
 - Req. Wait Time
 - Net. Wait Time
 - Act. Wait Time
 - Lock Wait Time
- A line graph that displays the following information:
 - Average Request CPU Time (s)
 - Total Application Requests Completed (Count)
 - Total Activities Completed (Count)
 - Total Application Commits (Count)
 - Total Application Rollbacks (Count)

- A line graph that displays the following information on sections:
 - Sections Sort Time (%)
 - Sections Process Time (%)
 - Transactions End Process Time (%)

- A line graph that displays the following information on locks:
 - Average Lock Timeouts Per Activities (Count)
 - Average Deadlocks per Activities (Count)
 - Average Lock Waits Per Activities (Count)

- A line graph that displays the following information on wait times:
 - Network Wait Time (%)
 - Caching Wait Time (%)
 - I/O Wait Time (%)
 - Requests Wait Time (%)
