Monitoring IBM MQ

IBM: MQ PowerPack version 100

Table of Contents

Chapter 1

Introduction

Overview

This manual describes how to monitor IBM MQ messaging systems in SL1 using the *IBM: MQ* PowerPack.

The following sections provide an overview of IBM MQ and the *IBM: MQ* PowerPack:

NOTE: ScienceLogic provides this documentation for the convenience of ScienceLogic customers. Some of the configuration information contained herein pertains to third-party vendor software that is subject to change without notice to ScienceLogic. ScienceLogic makes every attempt to maintain accurate technical information and cannot be held responsible for defects or changes in third-party vendor software. There is no written or implied guarantee that information contained herein will work for all third-party variants. See the End User License Agreement (EULA) for more information.

What is IBM MQ?

The IBM MQ is message-queing middleware that supports messaging between applications, systems, services, and files. An IBM MQ messaging system is made up of one or more queue managers that support asynchronous routing of messages between systems, with producing and consuming applications connected to different queue managers.

What Does the IBM: MQ PowerPack Monitor?

To monitor IBM MQ messaging systems using SL1, you must install the *IBM: MQ PowerPack*. This PowerPack enables you to discover, model, and collect data about IBM MQ messaging systems.

The *IBM: MQ* PowerPack includes:

- Example credentials you can use as a template to create a PowerShell credential or an SSH/Key credential to connect to the IBM MQ messaging system you want to monitor
- Dynamic Applications to discover, model, and monitor performance metrics and collect configuration data for IBM MQ messaging systems
- Device Classes for the IBM MQ components that the SL1 monitors
- Event Policies and corresponding alerts that are triggered when IBM MQ systems meet certain status criteria

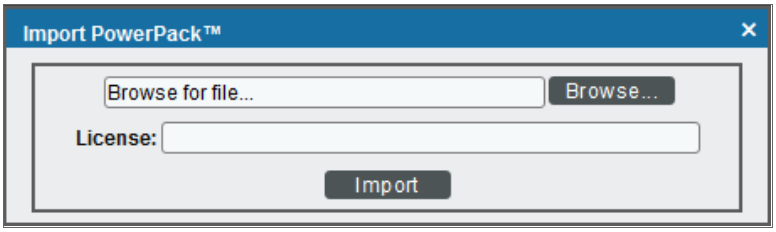
Installing the IBM: MQ PowerPack

Before completing the steps in this manual, you must import and install the latest version of the *IBM: MQ* PowerPack.

TIP: By default, installing a new version of a PowerPack overwrites all content from a previous version of that PowerPack that has already been installed on the target system. You can use the ***Enable Selective PowerPack Field Protection*** setting in the **Behavior Settings** page (System > Settings > Behavior) to prevent new PowerPacks from overwriting local changes for some commonly customized fields. (For more information, see the ***System Administration*** manual.)

To download and install a PowerPack:

1. Download the PowerPack from the ScienceLogic Customer Portal.
2. Go to the **PowerPack Manager** page (System > Manage > PowerPacks).
3. In the **PowerPack Manager** page, click the **[Actions]** button, then select *Import PowerPack*.
4. The **Import PowerPack** dialog box appears:



5. Click the **[Browse]** button and navigate to the PowerPack file.
6. When the **PowerPack Installer** modal appears, click the **[Install]** button to install the PowerPack.

> **NOTE:** If you exit the **PowerPack Installer** modal without installing the imported PowerPack, the imported PowerPack will not appear in the **PowerPack Manager** page. However, the imported PowerPack will appear in the **Imported PowerPacks** modal. This page appears when you click the **[Actions]** menu and select *Install PowerPack*.

Chapter 2

Configuration and Discovery

Overview

The following sections describe how to configure and discover IBM MQ messaging systems for monitoring by SL1 using the *IBM: MQ* PowerPack:

Prerequisites for Monitoring IBM MQ

To configure the SL1 system to monitor IBM MQ messaging systems using the *IBM: MQ* PowerPack, you must first perform the following:

- *Install the IBM MQ PowerShell Snap-in for Monitoring on Windows Servers*
- Give all users the "mgm" group permission

Installing the IBM MQ PowerShell Snap-In for Monitoring on Windows Servers

NOTE: Users monitoring MQ on Linux servers do not need to perform these steps.

NOTE: On 64-bit versions of Microsoft Windows, both 32-bit and 64-bit versions of Windows PowerShell are installed. SL1's collection processes using Windows PowerShell will default to using the version of powershell.exe whose folder exists first in the PATH environment variable. Because this will vary from system to system, these steps ensure the WebSphereMQ.dll file is registered for both Windows PowerShell environments.

1. Download the Windows PowerShell library package (mo74.zip) for IBM MQ from the following location: https://www.ibm.com/support/pages/mo74-websphere-mq-windows-powershell-library#:~:text=Download%20Description,queue%20managers%20from%20the%20PowerShell
2. Extract the contents of the zip file to your Windows server, and find the "manual" subfolder from the extracted files (under the mo74_v2.0.1_x86_x64 folder). Create a new folder on your desktop and move the files in the "manual" subfolder to that folder.
3. Register the IBM WebSphere MQ library for use by both 32-bit and 64-bit Windows PowerShell. To do this:

    - Start a 32-bit Windows PowerShell console window (this will be the Windows PowerShell (x86) application if running on a 64-bit version of Microsoft Windows) using "Run as adminstrator", run the following:

    ```
    %WINDIR%\Microsoft.NET\Framework\v4.0.30319\installutil <Directory where WebsphereMQ.dll resides>\WebSphereMQ.dll
    ```

    - Start a 64-bit Windows PowerShell console window (this will be the Windows PowerShell application without (x86) in its program name on a 64-bit version of Microsoft Windows) using "Run as adminstrator" and run the following:

    ```
    %WINDIR%\Microsoft.NET\Framework64\v4.0.30319\installutil <Directory where WebsphereMQ.dll resides>\WebSphereMQ.dll
    ```

4. Open your Windows PowerShell console and add the WebSphere MQ for PowerShell snap-in by running the following command:

    ```
    Add-PSSnapin IBM.PowerShell.WebSphereMQ
    ```

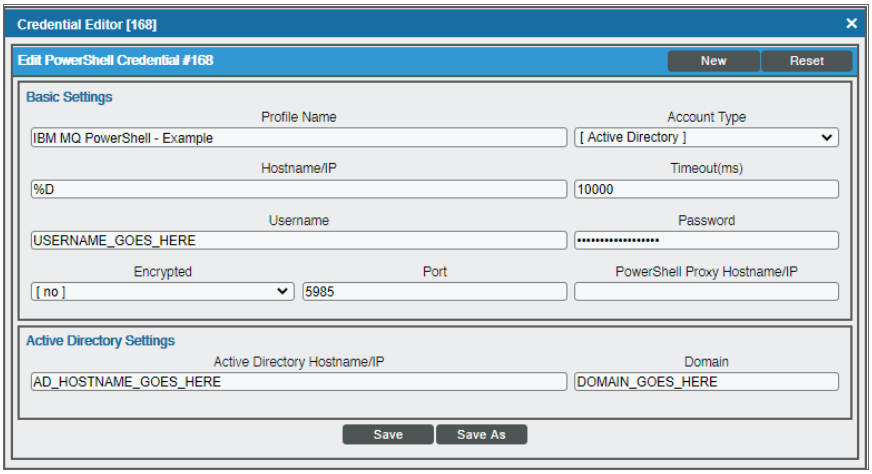
Creating a PowerShell Credential for IBM MQ on Windows Systems

To configure SL1 to monitor IBM MQ messaging systems on Windows systems, you must first create a PowerShell credential. This credential allows the Dynamic Applications in the *IBM: MQ* PowerPack to connect with an IBM MQ system.

The PowerPack includes an example PowerShell credential that you can edit for your own use.

To configure a PowerShell credential to access an IBM MQ system:

1. Go to the **Credential Management** page (System > Manage > Credentials).
2. Locate the **IBM MQ PowerShell - Example** credential, then click its wrench icon ( ). The **Edit PowerShell Credential** modal page appears:



3. Complete the following fields:
   - ***Credential Name***. Type a name for the IBM MQ credential.
   - ***Hostname/IP***. Leave at the default value of '%D'.
   - ***Username***. Type the username for a user with administrator access to the IBM MQ messaging system.
   - ***Password***. Type the password for the IBM MQ system account username.
4. Click the **[Save As]** button.

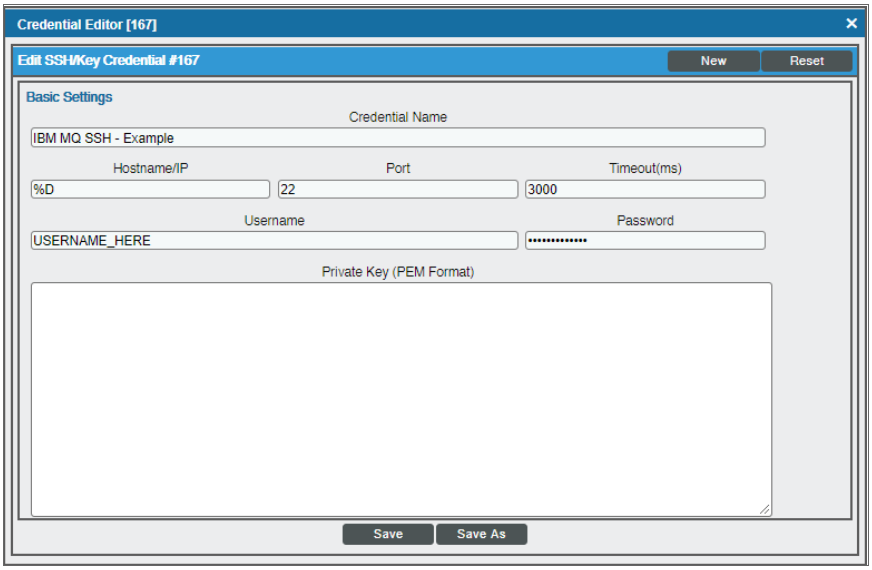
Creating an SSH/Key Credential for IBM MQ on Linux Systems

To configure SL1 to monitor IBM MQ messaging systems on Linux systems, you must first create an SSH/Key credential. This credential allows the Dynamic Applications in the *IBM: MQ* PowerPack to connect with an IBM MQ system.

The PowerPack includes an example SSH/Key credential that you can edit for your own use.

To configure an SSH/Key credential to access an IBM MQ system:

1. Go to the **Credential Management** page (System > Manage > Credentials).
2. Locate the **IBM MQ SSH - Example** credential, then click its wrench icon ( ). The **Edit SSH/Key Credential** modal page appears:

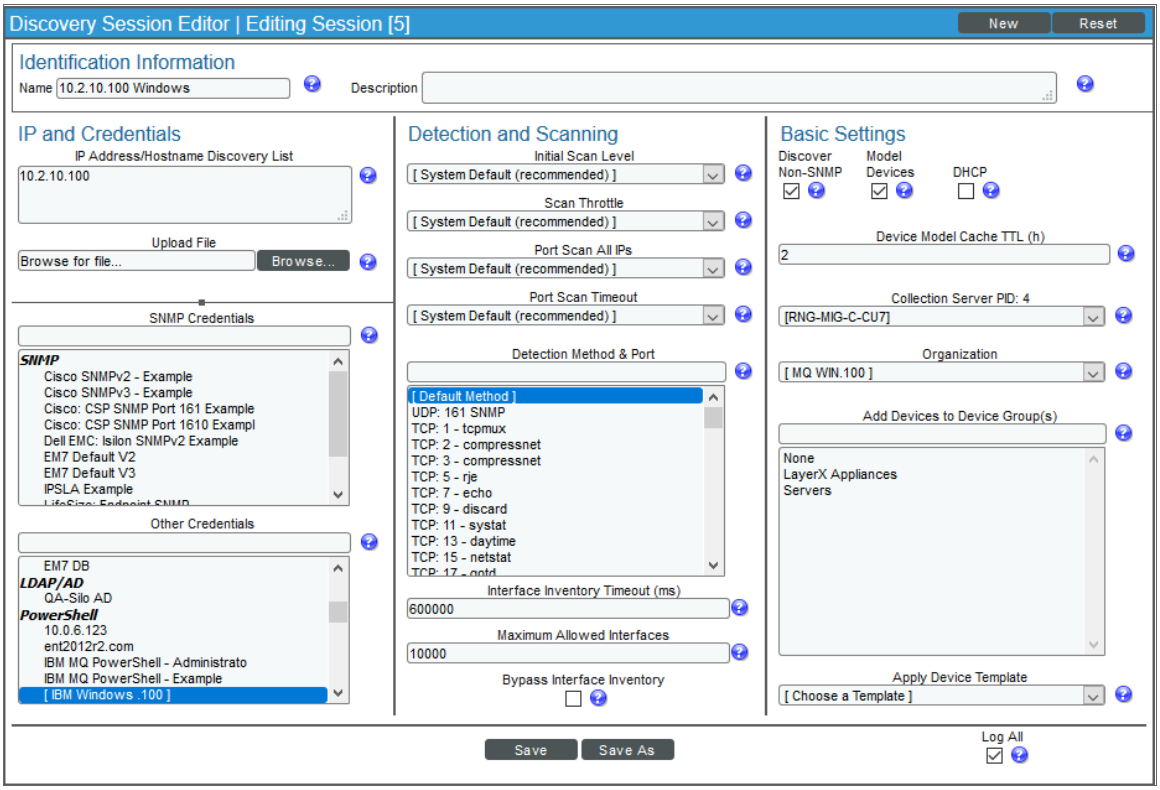


3. Complete the following fields:
   - ***Credential Name***. Type a name for the IBM MQ credential.
   - ***Hostname/IP***. Leave at the default value of '%D'.
   - ***Username***. Type the username for a user with administrator access, and who is a member of the "mgm" group, to the IBM MQ messaging system.
   - ***Password***. Type the password for the IBM MQ system account username.
4. Click the **[Save As]** button.

Discovering IBM MQ Component Devices

To discover an IBM MQ messaging system:

1. Go to the **Discovery Control Panel** page (System > Manage > Discovery).
2. In the **Discovery Control Panel**, click the **[Create]** button. The **Discovery Session Editor** page appears.



3. In the **Discovery Session Editor** page, complete the following fields:
   - ***Name***. Type a name for the discovery session.
   - ***IP Address/Hostname Discovery List***. Type the IP address for the IBM MQ messaging system.
   - ***Other Credentials***. Select the PowerShell or SSH/Key credential you created for the IBM MQ messaging system.
   - ***Discover Non-SNMP***. Select this checkbox.
   - ***Model Devices***. Select this checkbox.
4. Optionally, you can enter values in the other fields on this page. For more information about the other fields on this page, see the ***Discovery & Credentials*** manual.
5. Click the **[Save]** button to save the discovery session and then close the **Discovery Session Editor** window.

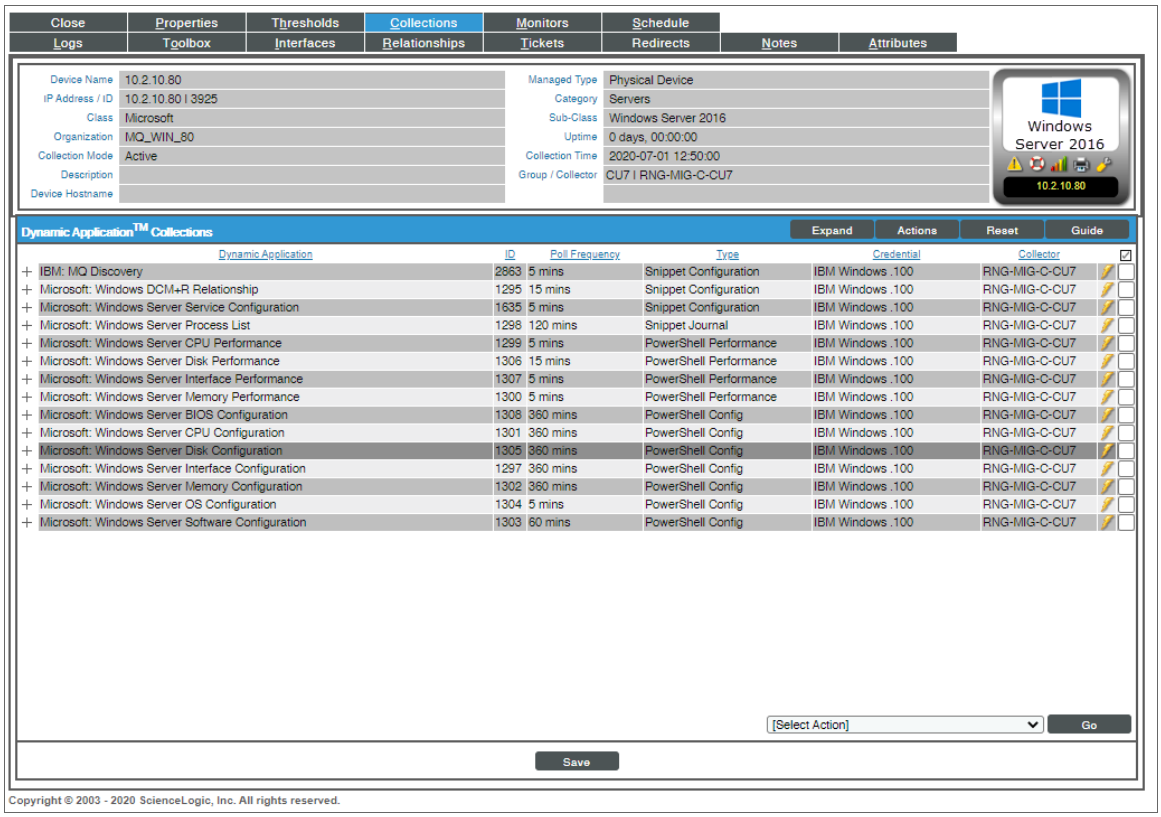
6. The discovery session you created appears at the top of the **Discovery Control Panel** page. Click its lightning-bolt icon ( ) to run the discovery session.
7. The **Discovery Session** window appears. When the cluster root device(s) are discovered, click the device icon ( ) to view the **Device Properties** page for each device.

Verifying Discovery and Dynamic Application Alignment

To verify that SL1 has automatically aligned the correct Dynamic Applications during discovery:

1. After discovery has completed, click the device icon for the IBM MQ device ( ). From the **Device Properties** page for the IBM MQ device, click the **[Collections]** tab. The **Dynamic Application Collections** page appears.
2. All applicable Dynamic Applications for the device are automatically aligned during discovery.

> **NOTE:** It can take several minutes after the discovery session has completed for Dynamic Applications to appear in the **Dynamic Application Collections** page.



You should see the following Dynamic Applications aligned to the IBM MQ root device:

- IBM: MQ Discovery

You should see the following Dynamic Applications aligned to the IBM MQ server:

- IBM: MQ Queue Manager Discovery

You should see the following Dynamic Applications aligned to the IBM MQ queue managers:

- IBM: MQ Cluster Channel Configuration

> **NOTE:** For Windows users, in the "IBM: MQ Cluster Channel Configuration" Dynamic Application, when a channel is configured with a cluster and that cluster is deleted, the status for that cluster cannot be returned.

> **NOTE:** For Windows users, in the "IBM: MQ Cluster Channel Configuration" Dynamic Application, the "CLUSSDRA" and "CLUSSDRB" are shown as "CLUSSDR".

- IBM: MQ Channel Configuration
- IBM: MQ Queue Discovery

> **NOTE:** For Windows users, the "IBM: MQ Discovery" Dynamic Application currently does not return "Connections", "Parent Queue Manager", or "Start Date" metrics. On some MQ installations, SL1 may be unable to collect the "Standby Host" property.

- IBM: MQ Queue Manager Configuration

> **NOTE:** For Windows users, the "IBM: MQ Queue Manager Configuration" Dynamic Application currently does not return "Connections", "Parent Queue Manager", or "Start Date" metrics.

You should see the following Dynamic Applications aligned to the IBM MQ queues:

- IBM: MQ Queue Configuration
- IBM: MQ Queue Performance

If the listed Dynamic Applications have not been automatically aligned during discovery, you can align them manually. To do so, perform the following steps:

1. Click the **[Action]** button and then select *Add Dynamic Application*. The **Dynamic Application Alignment** page appears:
2. In the ***Dynamic Applications*** field, select the Dynamic Application you want to align.
3. In the ***Credentials*** field, select the credential specified in the table.

4. Click the **[Save]** button.
5. Repeat steps 1-4 for the other unaligned Dynamic Applications.

Configuring the IBM: MQ Queue Discovery Snippet

The "IBM: MQ Queue Discovery" Dynamic Application snippet allows you to customize the list of queue names and types of queues that SL1 will discover. Up to 20 queue names can be specified, and those names will be discovered under each queue manager where they are found.

For specifying queue types, an integer can be specified as one item in the list, and the allowed values for type are:

1 : Dead letter queue will be discovered

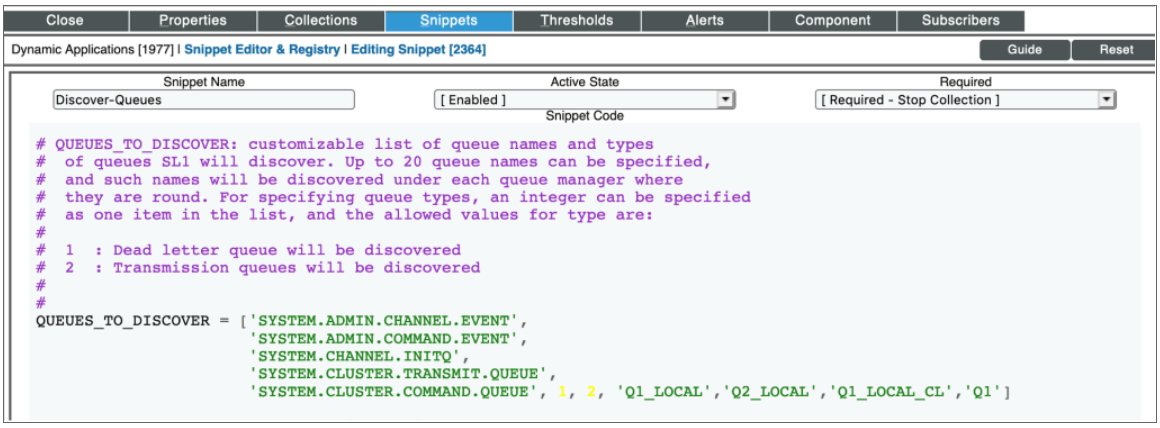
2 : Transmission queues will be discovered

To edit the snippet:

1. Go to the **Dynamic Applications Manager** page (System > Manage > Applications).
2. Find the "IBM: MQ Discovery" Dynamic Application and click its wrench icon ( ).
3. In the **Dynamic Applications Properties Editor**, click the **[Snippets]** tab.
4. In the **Dynamic Applications Snippet Editor & Registry** page, click the wrench icon ( ) of the "Discover-QueueManagers" snippet.
5. The content of the snippet will appear. Add the following text to the snippet to customize the list of queue names and queue types that can be discovered:

```
QUEUES_TO_DISCOVER = ['<queue name>','<queue name>','<queue type>']
```

Use commas to separate queue names and queue types.



Configuring the IBM: MQ Error Log Configuration Snippet

By default, only some errors are monitored and alerted in SL1. The IDs of the errors supported can be found in the snippet of the "IBM: MQ Error Log Configuration" Dynamic Application. You can add other error messages by adding the alert ID to the ALERT_ID_LIST list in the snippet.

To edit the snippet:

1. Go to the **Dynamic Applications Manager** page (System > Manage > Applications).
2. Find the "IBM: MQ Error Log Configuration" Dynamic Application and click its wrench icon ().
3. In the **Dynamic Applications Properties Editor**, click the **[Snippets]** tab.
4. In the **Dynamic Applications Snippet Editor & Registry** page, click the wrench icon () of the "Get-ErrorLogRecords" snippet.
5. The content of the snippet will appear. Add the alert IDs you want added to the `ALERT_ID_LIST` in the snippet:

```
def _log(trace, ui_debug=True):
    if ui_debug:
        self.logger.ui_debug("[App {}] {}: {}".format(self.app_id,
                                                      self.app_name, trace))
    else:
        self.logger.debug("[App {}] {}: {}".format(self.app_id, self.app_name,
                                                   trace))

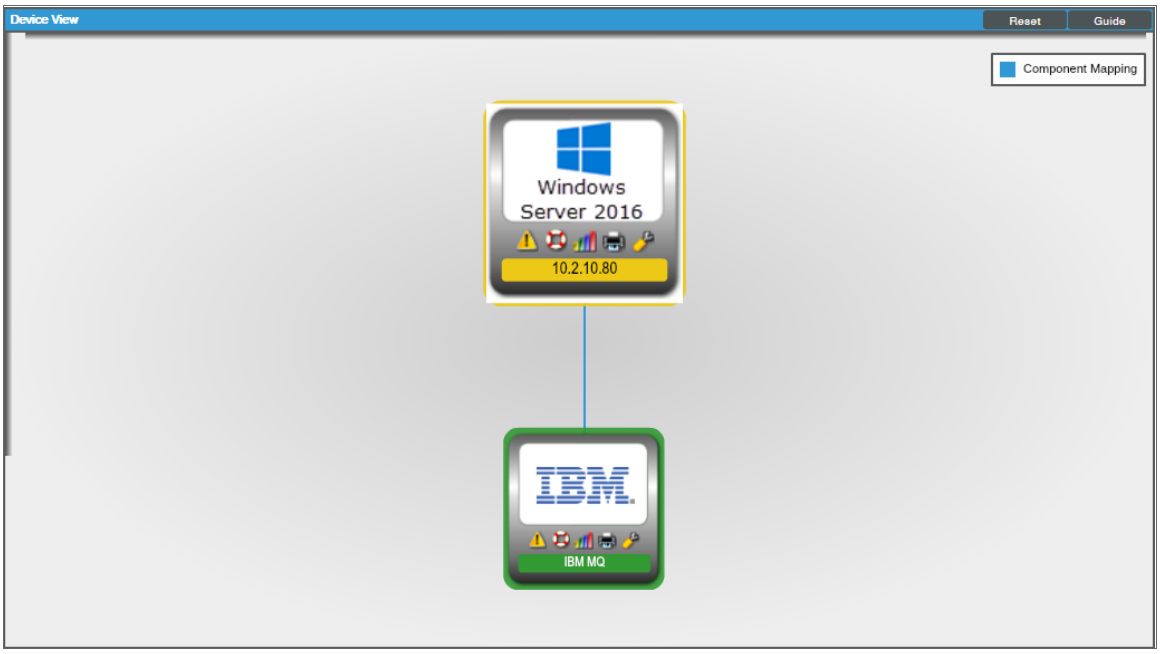
# This is a list with the alert ids that we want to read from IBM MQ logs file
ALERT_ID_LIST = ['AMQ5657W', 'AMQ8077W', 'AMQ5053W', 'AMQ6184W', 'AMQ6183W', 'AMQ6090I',
                 'AMQ4038W', 'AMQ4036W', 'AMQ4034W', 'AMQ4032W', 'AMQ5005E', 'AMQ5006E',
                 'AMQ5008S', 'AMQ5050S', 'AMQ5009S', 'AMQ5038S', 'AMQ5042E', 'AMQ5057E',
                 'AMQ5501E', 'AMQ5522E', 'AMQ5527E', 'AMQ5529E', 'AMQ9526E', 'AMQ9503E',
                 'AMQ9228E', 'AMQ9213E', 'AMQ9209E', 'AMQ9208E', 'AMQ9202E', 'AMQ8101S',
                 'AMQ6125E', 'AMQ6119S']

error_log_path = {"Windows": "C:\ProgramData\IBM\MQ\errors", "Linux": "/var/mqm/errors"}
```

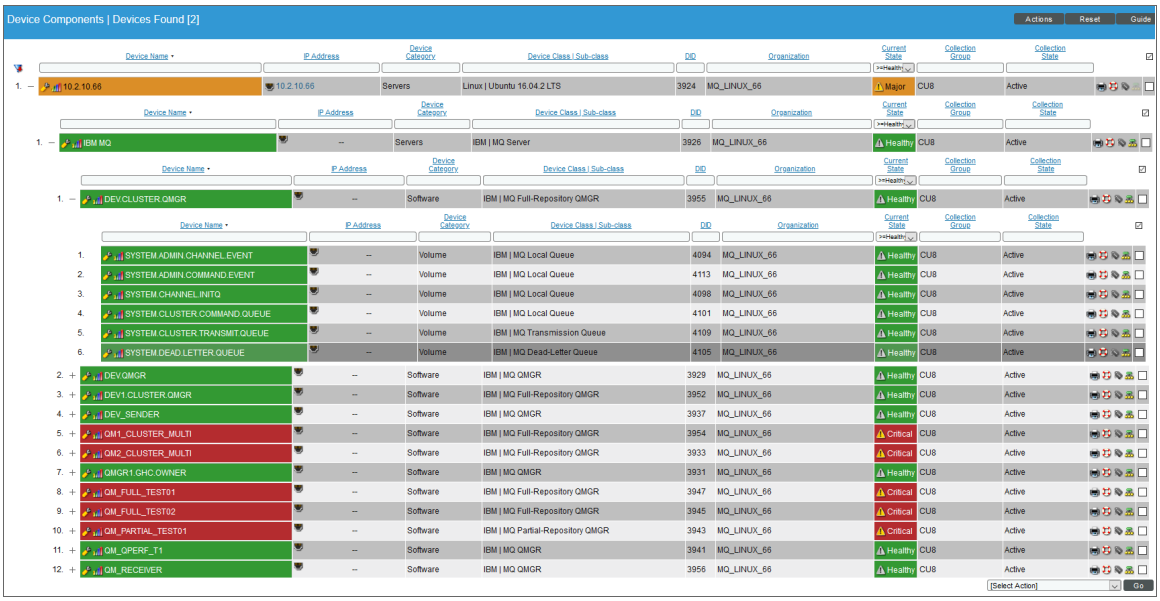
Viewing IBM MQ Component Devices

In addition to the **Device Manager** page (Registry > Devices > Device Manager), you can view the IBM MQ system and all associated component devices in the following places in the user interface:

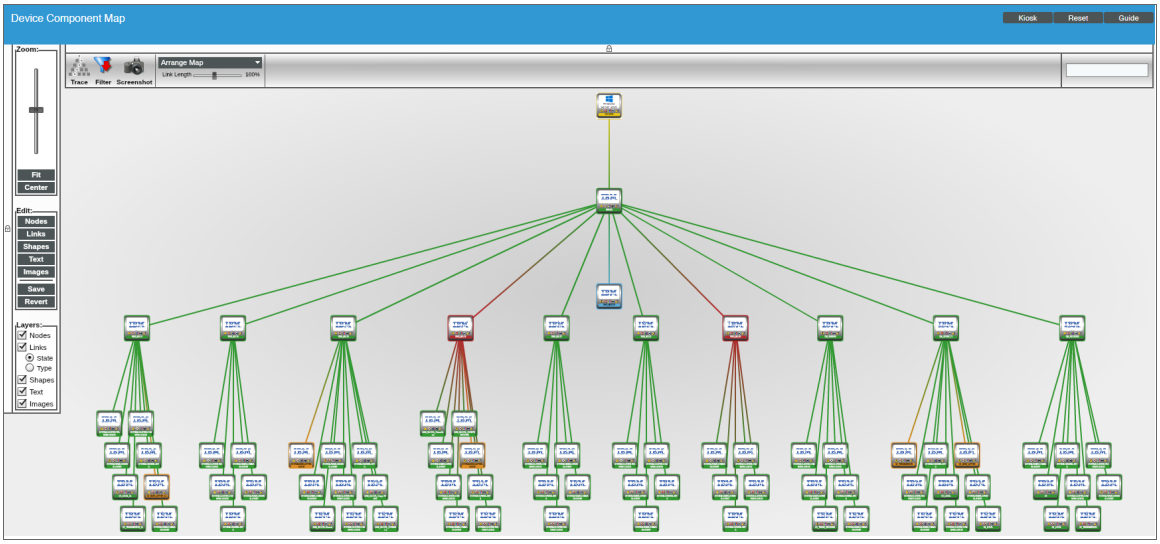
- The **Device View** modal page (click the bar-graph icon [] for a device, then click the **Topology** tab) displays a map of a particular device and all of the devices with which it has parent-child relationships. Double-clicking any of the devices listed reloads the page to make the selected device the primary device:



- The **Device Components** page (Registry > Devices > Device Components) displays a list of all root devices and component devices discovered by SL1 in an indented view, so you can easily view the hierarchy and relationships between child devices, parent devices, and root devices. To view the component devices associated with an IBM MQ system, find the IBM MQ device and click its plus icon (+):



- The **Component Map** page (Classic Maps > Device Maps > Components) allows you to view devices by root node and view the relationships between root nodes, parent components, and child components in a map. This makes it easy to visualize and manage root nodes and their components. SL1 automatically updates the **Component Map** as new component devices are discovered. The platform also updates each map with the latest status and event information. To view the map for an IBM MQ system, go to the **Component Map** page and select the map from the list in the left NavBar. To learn more about the **Component Map** page, see the ***Views*** manual.



Chapter 3

Dashboards

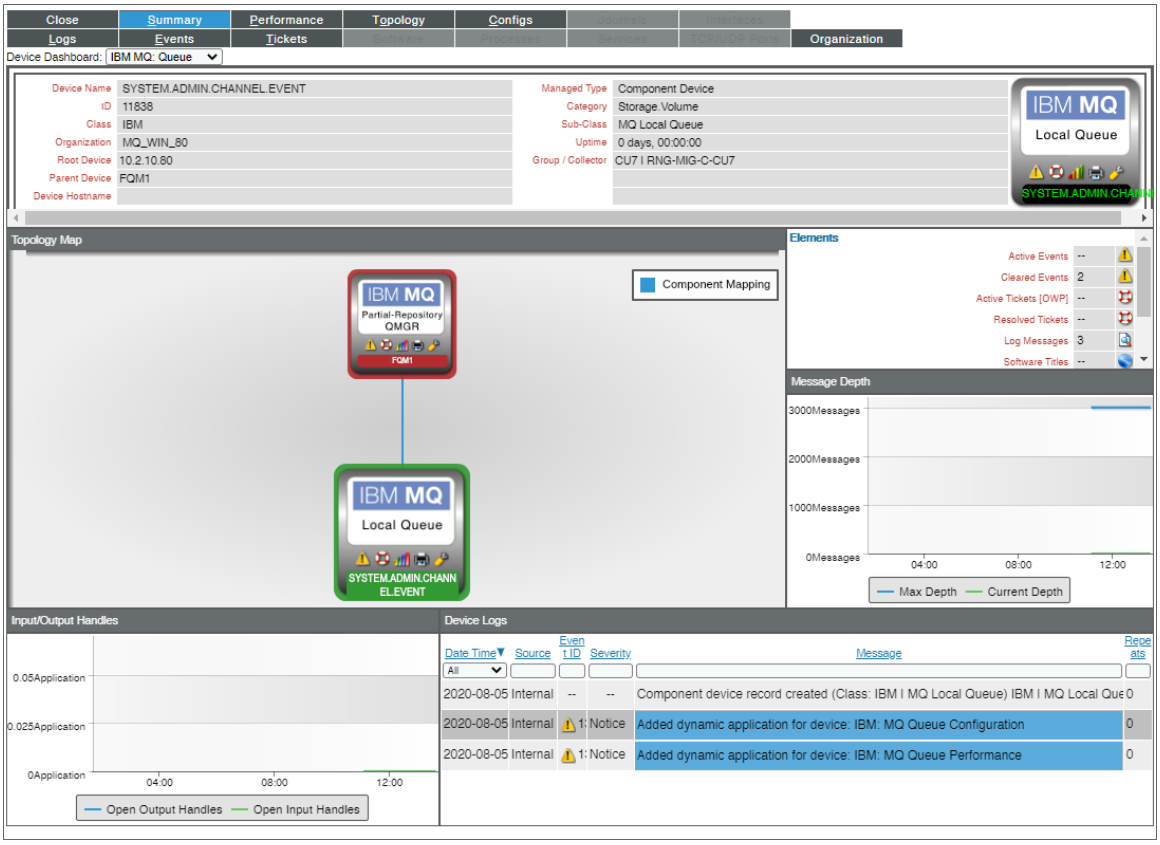
Overview

The *IBM: MQ* PowerPack contains device dashboards that present data related to your message queues and queue managers.

The following section provides a description of each dashboard:

IBM MQ Device Dashboards

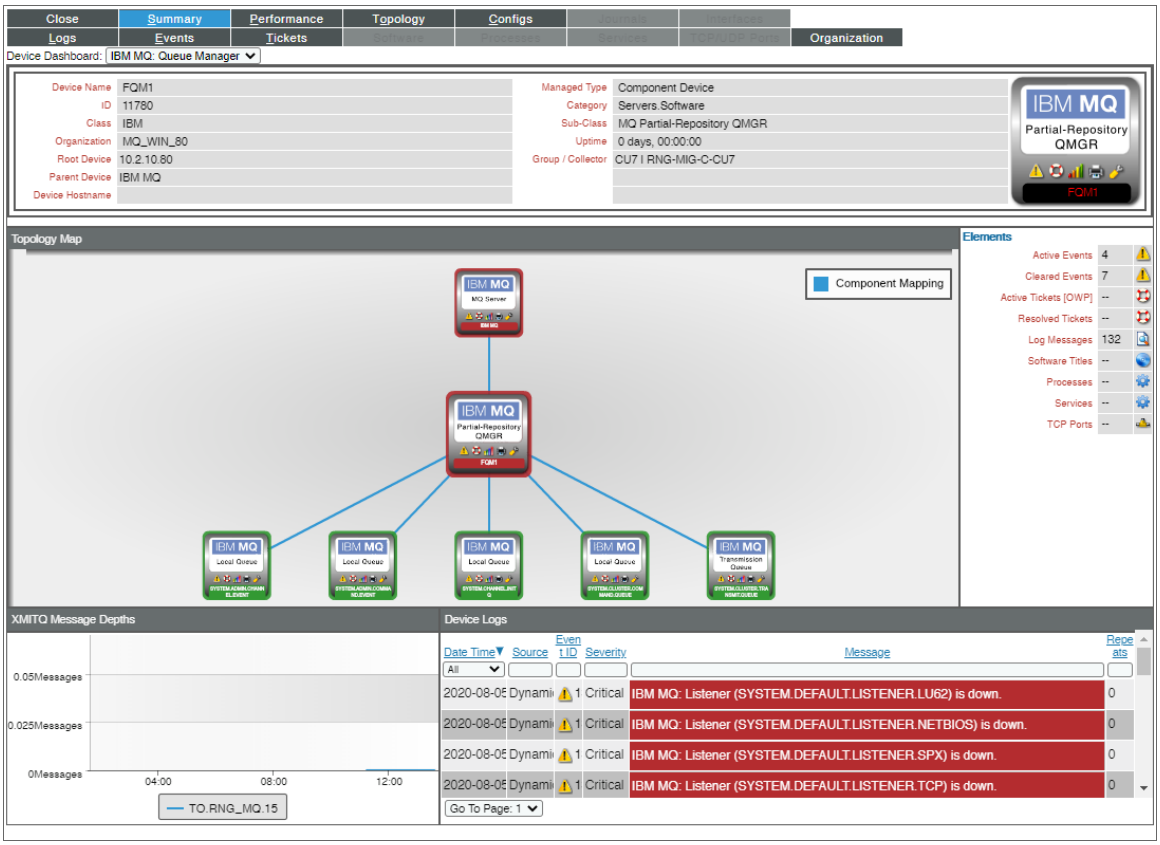
IBM MQ: Queue



The IBM MQ: Queue device dashboard displays the following information:

- A topology map of your queue
- A line graph that displays message depth
- A line graph that displays input and output handles
- A list of device logs displaying events

IBM MQ: Queue Manager



The IBM MQ: Queue Manager device dashboard displays the following information:

- A topology map of your queue manager
- A line graph that displays XMITQ message depths
- A list of device logs displaying events
