## Introduction to the ServiceNow Events Synchronization PowerPack

---

### Overview

This chapter describes the *ServiceNow Events Synchronization PowerPack*, which is the ScienceLogic integration with the ServiceNow Events Module. This Synchronization PowerPack provides a bi-directional sync of SL1 Events with ServiceNow Alerts, including event creation, acknowledgment, and resolution.

This Synchronization PowerPack requires a ServiceNow MID Server.

**WARNING:** You should not use the *ServiceNow Events Synchronization PowerPack* and the *ServiceNow Incident Synchronization PowerPack* on the same PowerFlow system.

**NOTE:** After the 2.1.0 platform release, the *Integration Service* was rebranded as *SL1 PowerFlow*, and the *Automation Builder* was rebranded as *SL1 PowerFlow builder*.

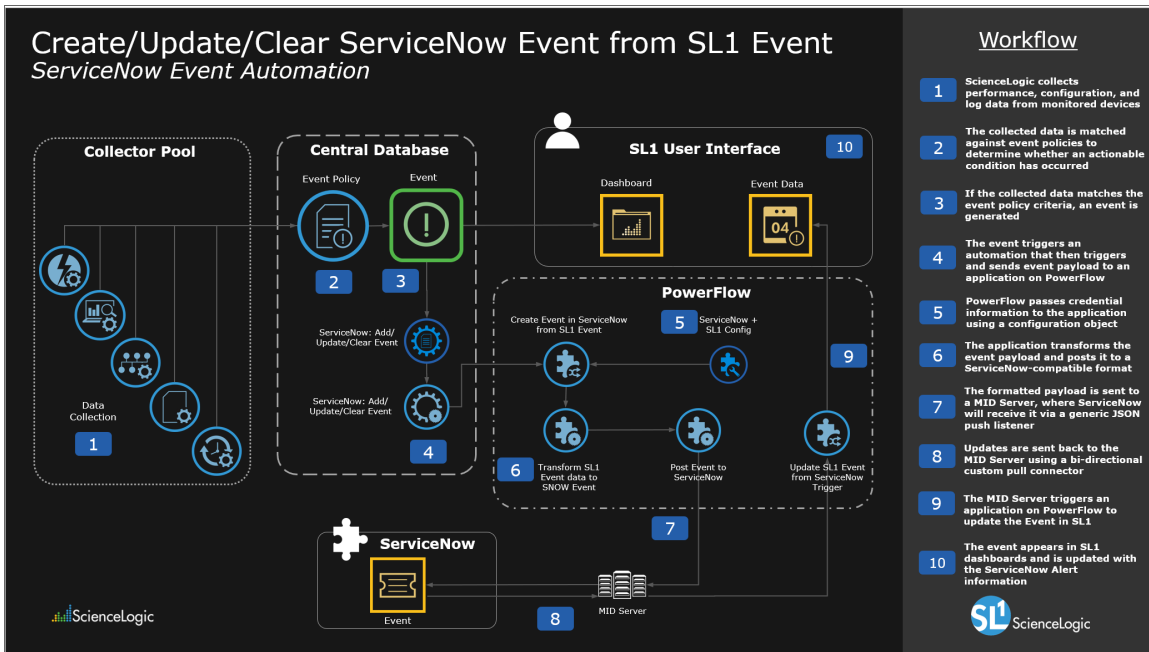

**NOTE:** The label "SyncPack" is used in place of "Synchronization PowerPack" in the PowerFlow user interface.

This chapter covers the following topics:

<i>Event Integration Architecture and Workflow</i> .....	5
<i>SL1 and ServiceNow Terminology</i> .....	5
<i>Dependency Map for ServiceNow Synchronization PowerPacks</i> .....	6
<i>Prerequisites for ServiceNow Synchronization PowerPacks</i> .....	6

## Event Integration Architecture and Workflow

The following diagram details the workflow and architecture for the bi-directional sync of SL1 Events with ServiceNow Alerts, including event creation, acknowledgment, and resolution:

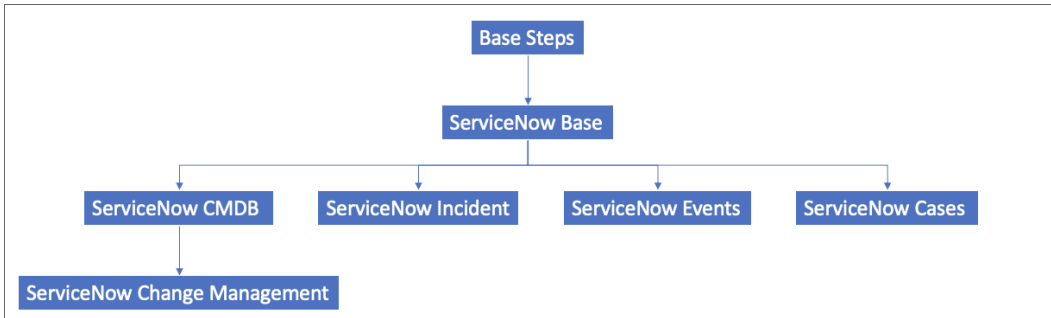

## SL1 and ServiceNow Terminology

The following table lists the different names for the shared elements in SL1 and ServiceNow:

SL1	ServiceNow
Asset, Custom Attribute	Asset (ITAM)
Device	CI (Configuration Item)
Discovery Session	Service Request, Catalog Request
Event	Incident, Event, or Case (depending on the Synchronization PowerPack you are using)
Alert	Event
Organization	Company, Domain
Schedule, Maintenance Schedule	Change Request, Change Schedule
Topology, Relationships, Dynamic Component Mapping and Relationships (DCM+R)	Dependency View, Affected CIs

# Dependency Map for ServiceNow Synchronization PowerPacks

The following graphic describes which Synchronization PowerPacks depend on other Synchronization PowerPacks:

**TIP:** For more information about the Standard Base Steps Synchronization PowerPack, see the *SL1 PowerFlow Platform* manual.

## Prerequisites for ServiceNow Synchronization PowerPacks

This section describes the prerequisites for the ServiceNow Synchronization PowerPacks. For more information about the specific software versions required by a ServiceNow Synchronization PowerPack, see the release notes for that Synchronization PowerPack.

To install any of the ScienceLogic ServiceNow Synchronization PowerPacks, you must have administrator access to both SL1 and ServiceNow. Specifically, you will need:

- ScienceLogic administrator access to the Administration Portal
- ServiceNow administrator access

**TIP:** If you want to upload and install multiple ServiceNow Synchronization PowerPacks at the same time, you should upload *all* of the Synchronization PowerPacks first, and then install them to address any dependencies between the Synchronization PowerPacks.

The following table lists the port access required by PowerFlow and this Synchronization PowerPack:

Source IP	PowerFlow Destination	PowerFlow Source Port	Destination Port	Requirement
PowerFlow	SL1 API	Any	TCP 443	SL1 API Access
PowerFlow	ServiceNow API	Any	TCP 443	ServiceNow API Access

**NOTE:** ScienceLogic highly recommends that you disable all firewall session-limiting policies. Firewalls will drop HTTPS requests, which results in data loss.

---

## Contents of the Synchronization PowerPack

This section lists the contents of the *ServiceNow Events Synchronization PowerPack*.

### PowerFlow Applications

The following applications are included with the *ServiceNow Events Synchronization PowerPack*:

- **Create Event in ServiceNow from SL1 Event.** Transforms SL1 event data into a ServiceNow event, and then posts that event to ServiceNow.
- **Update SL1 Event from ServiceNow Trigger.** Updates or clears an SL1 Event based on a ServiceNow action.
- **Update SL1 Events.** Updates SL1 events based on the method selected in the configuration

### Steps

- Convert ScienceLogic Event Data to SNOW Event
- Process Event Trigger from ServiceNow

---

# Chapter

# 2

## Installing the Events Synchronization PowerPack

---

### Overview

This chapter describes how to install the *ServiceNow Events Synchronization PowerPack* in PowerFlow, and how to install the *ServiceNow Base Pack PowerPack* in SL1.

This chapter covers the following topics:

<i>Downloading and Installing the Synchronization PowerPack</i> .....	9
<i>Installing the ServiceNow Base Pack PowerPack in SL1</i> .....	11

---

## Downloading and Installing the Synchronization PowerPack

A Synchronization PowerPack file has the **.whl** file extension type. You can download the Synchronization PowerPack file from the ScienceLogic Support site.

**WARNING:** If you are *upgrading* to this version of the Synchronization PowerPack from a previous version, make a note of any settings you made on the **Configuration** pane of the various PowerFlow applications in this Synchronization PowerPack, as these settings are *not* retained when you upgrade.

To locate and download the Synchronization PowerPack:

1. Go to the [ScienceLogic Support Site](#).
2. Click the **[Product Downloads]** tab and select *PowerPack*.
3. In the **Search PowerPacks** field, search for the Synchronization PowerPack and select it from the search results. The **Release Version** page appears.
4. On the **[PowerPack Versions]** tab, click the name of the Synchronization PowerPack version that you want to install. The **Release File Details** page appears.
5. Click the **[Download File]** button or click the name of the **.zip** file containing the **.whl** file for this Synchronization PowerPack to start downloading the file.

**NOTE:** Synchronization PowerPacks do not require a specific license. After you download a Synchronization PowerPack, you can import it to your PowerFlow system using the PowerFlow user interface.

**NOTE:** If you are installing or upgrading to the latest version of this Synchronization PowerPack in an offline deployment, see "Installing or Upgrading in an Offline Environment" in the Synchronization PowerPack release notes to ensure you install any external dependencies.

## Importing the Synchronization PowerPack

To import a Synchronization PowerPack in the PowerFlow user interface:

1. On the **SyncPacks** page of the PowerFlow user interface, click **[Import SyncPack]**. The **Import SyncPack** page appears.
2. Click **[Browse]** and select the **.whl** file for the Synchronization PowerPack you want to install.

**TIP:** You can also drag and drop a **.whl** file to the **SyncPacks** page.

3. Click **[Import]**. PowerFlow registers and uploads the Synchronization PowerPack. The Synchronization PowerPack is added to the **SyncPacks** page.

**NOTE:** You cannot edit the content package in a Synchronization PowerPack published by ScienceLogic. You must make a copy of a ScienceLogic Synchronization PowerPack and save your changes to the new Synchronization PowerPack to prevent overwriting any information in the original Synchronization PowerPack when upgrading.

## Installing the Synchronization PowerPack

**NOTE:** You must import and install the *ServiceNow Base Synchronization PowerPack* before uploading and installing any of the other ServiceNow Synchronization PowerPacks.

To install a Synchronization PowerPack in the PowerFlow user interface:

1. On the **SyncPacks** page of the PowerFlow user interface, click the **[Actions]** button (  ) for the Synchronization PowerPack you want to install and select *Activate & Install*. The **Activate & Install SyncPack** modal appears.

**TIP:** By default, the **SyncPacks** page displays only activated and installed PowerPacks. If you do not see the PowerPack that you want to install, click the Filter icon (  ) on the **SyncPacks** page and select *Toggle Inactive SyncPacks* to see a list of the uninstalled PowerPacks.

2. Click **[Yes]** to confirm the activation and installation. When the Synchronization PowerPack is activated, the **SyncPacks** page displays a green check mark icon (  ) for that Synchronization PowerPack. If the activation or installation failed, then a red exclamation mark icon (  ) appears.

**TIP:** While the Synchronization PowerPack is installing, you cannot click any of the options that appear when you click the **[Actions]** button (  ).

3. For more information about the activation and installation process, click the check mark icon (  ) or the exclamation mark icon (  ) in the **Activated** column for that Synchronization PowerPack. For a successful installation, the "Activate & Install SyncPack" application appears, and you can view the Step Log for the steps. For a failed installation, the **Error Logs** window appears.
4. If you have other versions of the same Synchronization PowerPack on your PowerFlow system, you can click the **[Actions]** button (  ) for that Synchronization PowerPack and select *Change active version* to activate a different version other than the version that is currently running.

**TIP:** The most common error that occurs when installing a Synchronization PowerPack is that the Synchronization PowerPack dependencies are not installed. Review the "System Requirements" section of the release notes for that Synchronization PowerPack to ensure that you have installed all of the required applications for that Synchronization PowerPack. To view a list of additional PowerFlow and SL1 products that are required by the various Synchronization PowerPacks, see the SL1 PowerFlow Dependency Matrix.

---

## Installing the ServiceNow Base Pack PowerPack in SL1

The *ServiceNow Base Pack PowerPack* version 103 or later contains Run Book Automations that you use to integrate with the ServiceNow Events module.

**TIP:** By default, installing a new version of a PowerPack overwrites all content in that PowerPack that has already been installed on the target system. You can use the **Enable Selective PowerPack Field Protection** setting in the **Behavior Settings** page (System > Settings > Behavior) to prevent new PowerPacks from overwriting local changes for some commonly customized fields. For more information, see the **System Administration** manual.

To install the *ServiceNow Base Pack* PowerPack:

1. Search for and download the *ServiceNow Base Pack* PowerPack from the **PowerPacks** page on the [ScienceLogic Support Site](#).
2. In SL1, go to the **PowerPack Manager** page (System > Manage > PowerPacks).
3. Click the **Actions** menu and choose *Import PowerPack*. The **Import PowerPack** modal appears.
4. Click **[Browse]** and navigate to the *ServiceNow Base Pack* PowerPack file from step 1.
5. Select the PowerPack file and click **[Import]**. The **PowerPack Installer** modal page displays a list of the PowerPack contents.
6. Click **[Install]**. After the installation is complete, the *ServiceNow Base Pack* PowerPack appears on the **PowerPack Manager** page.

---

## Configuring Applications for the Events Synchronization PowerPack

---

### Overview

This chapter describes how to configure the bi-directional Event integration between ServiceNow and SL1.

This chapter covers the following topics:

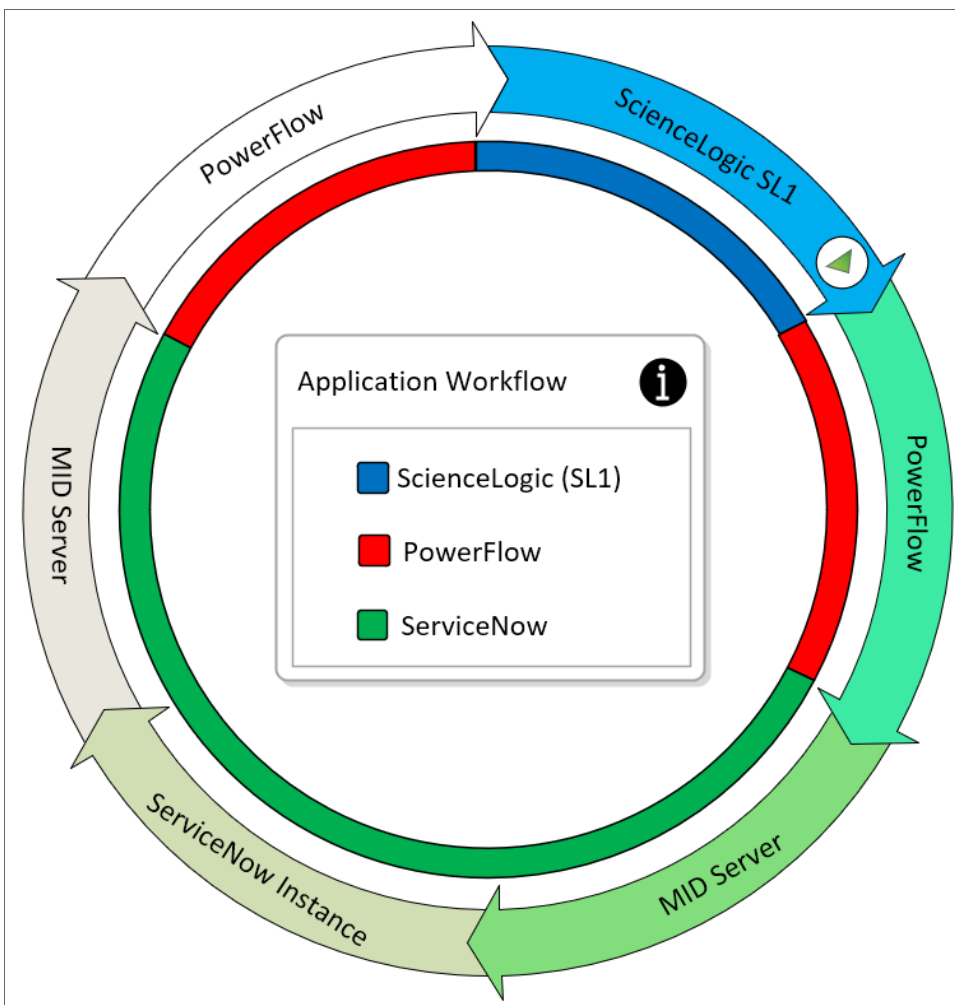

<i>An Overview of Configuring Event Integration</i> .....	13
<i>Workflow for Configuring Event Integration</i> .....	17
<i>Configuring the ServiceNow MID Server</i> .....	18
<i>Using the MID Server Script Include (ScienceLogic_JS) in ServiceNow</i> .....	20
<i>Installing the "ScienceLogic SL1: Event Integration" (Scoped) Application in ServiceNow</i> .....	22
<i>Configuring the Connector Definitions in ServiceNow</i> .....	22
<i>Configuring the Connector Instance in ServiceNow</i> .....	24
<i>Creating a ServiceNow Credential in SL1</i> .....	27
<i>Enabling the Run Book Automation Policies in SL1</i> .....	29
<i>Enabling and Customizing the Run Book Action Policy</i> .....	31
<i>Sending Custom Data to ServiceNow Using the Passthrough Option</i> .....	33
<i>Configuring the "ServiceNow: [Events] - Click to Create" Automation Policy</i> .....	37
<i>Creating and Aligning a Configuration Object in PowerFlow</i> .....	38

## An Overview of Configuring Event Integration

The bi-directional Event integration provided by the *ServiceNow Events Synchronization PowerPack* requires the following components:

- An SL1 instance (the ScienceLogic platform)
- The PowerFlow system
- A ServiceNow Management, Instrumentation, and Discovery (MID) Server, which includes an Event Listener
- A ServiceNow instance

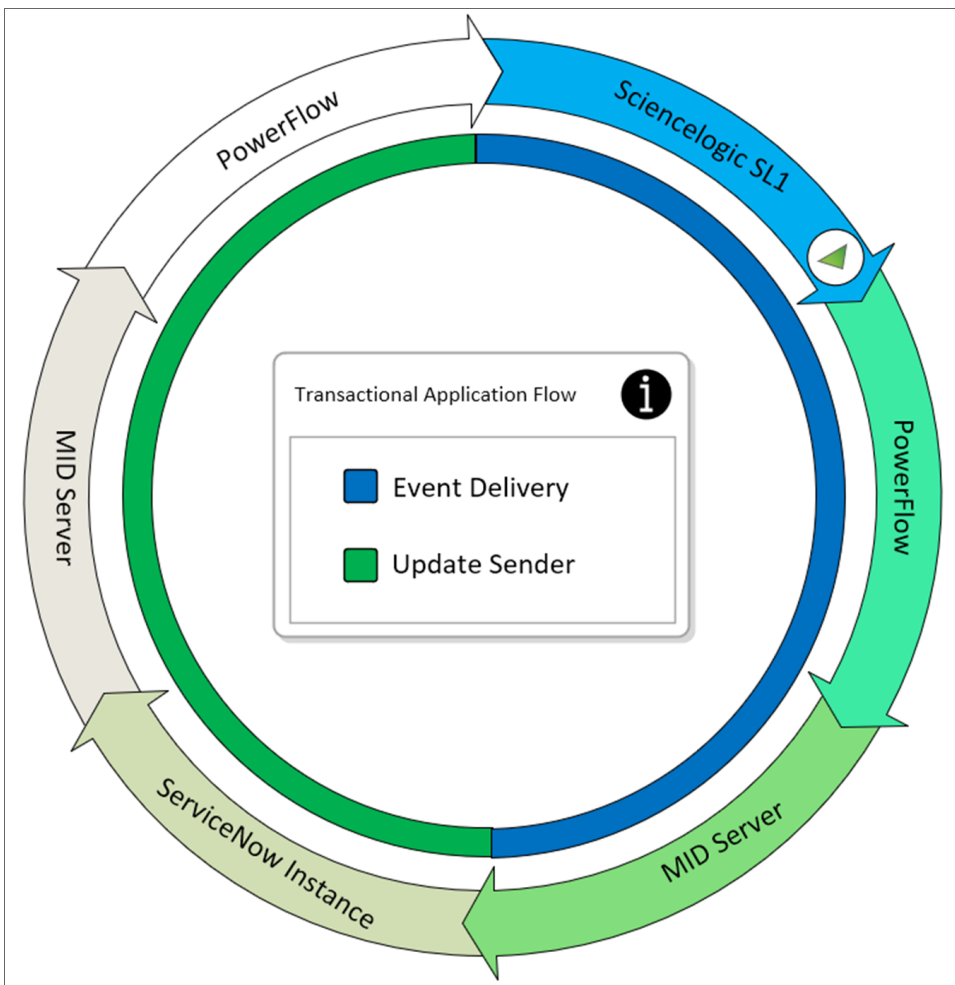

The following diagram shows the flow of Event data through these different components, starting with SL1 :

The Event integration includes two main transaction types:

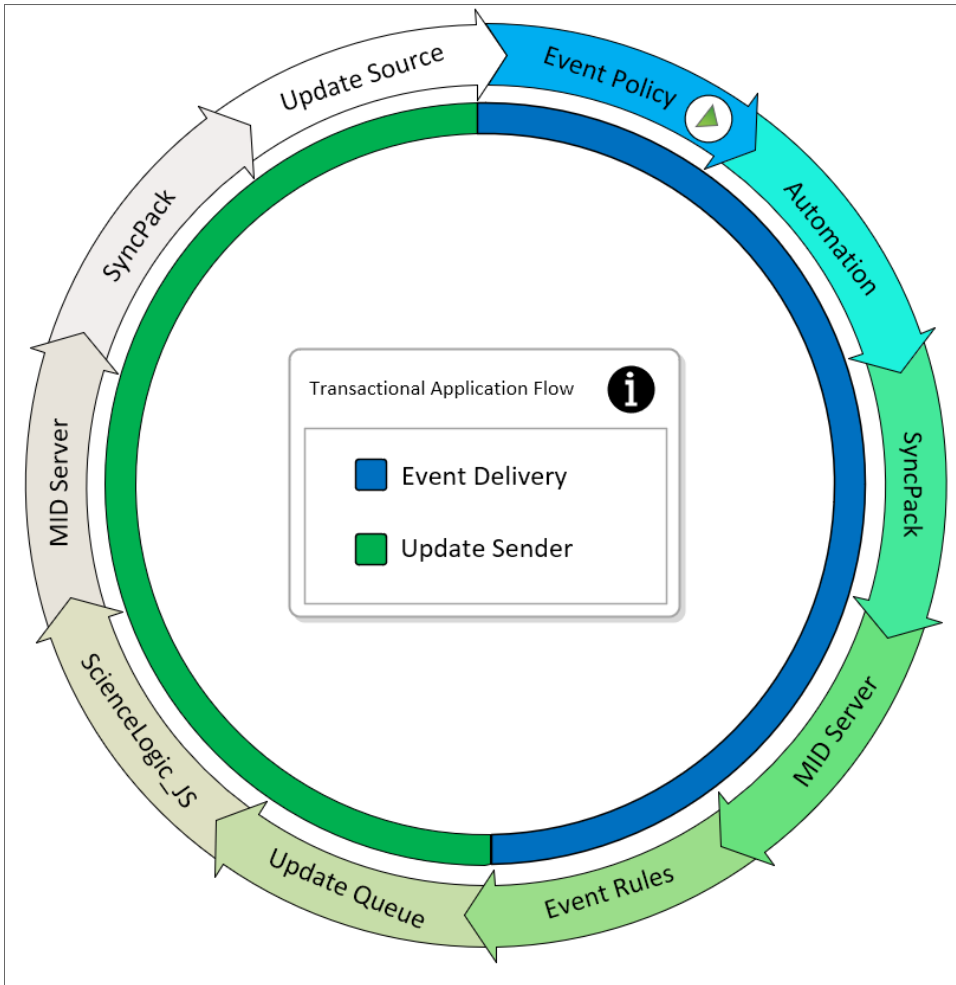

- **Event Delivery.** Sends SL1 Events to ServiceNow using a push methodology. This method incorporates three technologies starting with SL1, followed by PowerFlow, and ending with the ServiceNow MID Server Event Listener. In the following diagram, Event Delivery is represented by the blue half-circle inside the arrows on the right.
- **Update Sender.** Sends updates or changes to Alerts from the ServiceNow instance to the MID Server, which determines which Alert changes should be bundled and sent back to PowerFlow. Next, PowerFlow syncs the Alert changes with SL1 Events. In the following diagram, Update Sender is represented by the green half-circle inside the arrows on the left.

The following diagram shows the flow of the **Event Delivery** and **Update Sender** transactions through the different components, starting with SL1:

The major transaction workflow is made up of many steps that end with the delivery of an Alert triggered in SL1, and the process ends with updating Events back to PowerFlow. Each step is responsible for either evaluating, transforming, or moving data between different components or within a component.

The following diagram displays the different steps and components used by the **Event Delivery** and **Update Sender** transactions:

The **Event Delivery** transaction uses the following steps and components:

- **Event Policy.** A system-defined event trigger in SL1 starts the **Event Delivery** transaction.
- **Automation** (also called a Run Book Automation). Lets you specify the actions you want SL1 to execute automatically when specific event conditions are met. Be sure to configure the Automation correctly, as it is the first step in passing Alert and resulting Event data to another application.
- **SyncPack** (ServiceNow Events Synchronization PowerPack). The SyncPack sends the Event to ServiceNow and handles the data received from SL1. Based on the configuration, the SyncPack transforms or formats the data to ServiceNow JSON-defined format and forwards the message on to MID Server. This is a triggered PowerFlow application and is not scheduled-based.

- **MID Server.** The Event Listener on the MID Server listens on a user-defined port, and it takes the JSON objects it receives from the SyncPack and applies them to the Event table (**em\_event**). While there are multiple ways to handle events from an outside source, SL1 pushes Events to the MID WebService Event Collector using a JSONv2-formatted message defined by ServiceNow.
- **Event Rules.** These rules are not defined within the "ScienceLogic SL1: Event Automation" application (also called the Certified Application), but they have a direct impact on the Event raising an Alert.

The **Update Sender** transaction, which updates Alerts that are being sent back to their original sources, uses the following steps and components:

- **Update Queue.** A ServiceNow-developed business rule that sits on the Alert table (**em\_alert**). This rule tracks any changes to a record, including all the delta changes when records are inserted or updated. The rule posts the changes to the **connector update queue** table for bulk export back to the source.
- **ScienceLogic\_JS.** MID Server Script Include delivered with the ScienceLogic Application. This handles what is updated back to the Sender.
- **MID Server.** Sends the payload compiled by the MID Server script to PowerFlow.
- **SyncPack** (*ServiceNow Events Synchronization PowerPack*). Handles the payload received from the MID Server script about updates that need to be made to specific SL1 Events.
- **Update Source.** Makes the changes directly to the required SL1 Events.

**TIP:** For more information about troubleshooting the configuration, see [Troubleshooting Event Delivery and Update Sender Transactions](#).

---

# Workflow for Configuring Event Integration

The following topics cover how to configure the various components that make up the Event integration:

## Configuring the ServiceNow MID Server

1. [Install the MID Server.](#)
2. [Configure the MID Web Server.](#)
3. [Configure the MID WebService Event Collector.](#)
4. [Start the MID Web Server and the Event Collector.](#)
5. [Run an external test of the MID Server configuration.](#)

## Configuring the ServiceNow Instance

1. Install the ServiceNow Event Management plugin (**com.glideapp.itom.snac**). You can request this plugin directly from ServiceNow.
2. [Install the "ScienceLogic SL1: Event Integration" \(Scoped\) application](#) (also called the Scoped or Certified application).
3. [Review the MID Server Script Include \(ScienceLogic\\_JS\).](#)
4. [Configure the Connector Definitions.](#)
5. [Create a ServiceNow credential to use with the Connector Instance.](#)
6. [Configure the Connector Instance.](#)

## Configuring the SL1 Instance

1. [Install the ServiceNow Base Pack PowerPack](#) version 103 or later.
2. [Create a ServiceNow credential in SL1.](#)
3. [Enable the following Run Book Automation Policies:](#)
  - ServiceNow: [Events] - Add/Update
  - ServiceNow: [Events] - Event Acknowledged
  - ServiceNow: [Events] - Event Cleared
4. [Enable the "ServiceNow: Add/Update/Clear Event" Run Book Action.](#)
5. [Optionally, send custom data to ServiceNow using the Pass-through Option.](#)
6. [Optionally, enable the "ServiceNow: \[Events\] - Click to Create" Automation Policy.](#)

## Configuring the PowerFlow System

1. [Install the ServiceNow Events Synchronization PowerPack.](#)
2. [Create a configuration object in the PowerFlow user interface.](#)

3. *Align the new configuration file with the following PowerFlow applications:*

- "Create Event in ServiceNow from SL1 Event"
- "Update SL1 Event from ServiceNow Trigger"
- "Update SL1 Events"

---

## Configuring the ServiceNow MID Server

See the following link for instructions on installing and configuring the MID Server for your ServiceNow instance: [MID Server installation](#).

After you set up the MID Server, you can use the following procedures to configure the ServiceNow MID Server to work with the *ServiceNow Events Synchronization PowerPack*.

## Configuring the MID Web Server

To configure the MID Web Server (a MID Server is required for this step):

1. In ServiceNow, install the Event Management plugin. You can request this plugin directly from ServiceNow.
2. Navigate to **Mid Server > Extensions > MID Web Server**. The **Mid Web Server Contexts** page appears.
3. Click **[New]** and complete the following fields on the new record:
  - **Name**. Type a unique name. Required.
  - **HTTP/HTTPS Port**: Specify a port number to listen on. The port number must be unique.
  - **Authentication Type**: Select *Basic*. Currently Basic is the only supported Authentication method. Complete the **Basic Auth User** and **Basic Auth User Password** fields with the relevant credentials.
  - **Execute on**: Select a specific MID Server or Cluster of MID Servers.
  - **MID Server**: Specify the MID Server or Mid Server Cluster you will use.

The screenshot displays the configuration form for a new MID Web Server Context. The form includes the following fields and values:

- Name**: Sciencologic
- HTTP/HTTPS Port**: 8,097
- Authentication Type**: Basic
- Basic Auth User**: lofuser
- Basic Auth User Password**: Masked with asterisks
- Execute on**: Specific MID Server
- MID Server**: pmn\_now\_11\_150\_01
- Executing on**: pmn\_now\_11\_150\_01
- Status**: Started

Buttons for **Update** and **Delete** are visible. The **Related Links** section includes **Start**, **Stop**, **Restart**, **Test parameters**, and **Update parameters**.

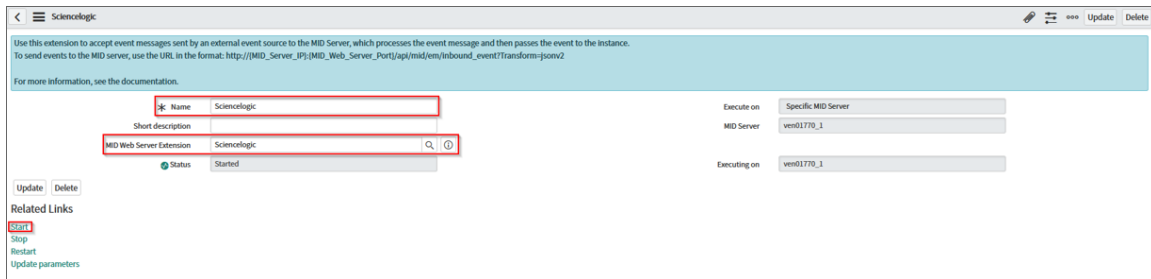

4. Click **[Submit]** to save the new record.

**NOTE:** In the **Related Links** section, the **Test parameters** option is not a valid test to confirm your setup.

# Configuring the MID WebService Event Collector

To configure the MID WebService Event Collector:

1. In ServiceNow, navigate to **Mid Server > Extensions > MID WebService Event Listener**.
2. Click **[New]** and complete the following fields on the new record:
  - **Name**. Type a unique name. Required.
  - **MID Web Server Extension** : Select the MID Web Server you created in [Configuring the MID Web Server](#).

3. Click **[Submit]** to save the new record.

# Starting the MID Web Server and the Event Collector

To start the MID Web Server and the Event Listener:

1. Navigate the **MID Server > Extensions > Mid Web Server** and select the MID Web Server you set up in [Configuring the MID Web Server](#).
2. In the **Related Links** section, click the **Start** link.
3. Navigate to the **MID Server > Extensions > MID WebService Event Listener** and select the MID WebService Event Listener you set up in [Configuring the MID WebService Event Collector](#).
4. In the **Related Links** section, click the **Start** link.
5. Confirm that the MID Web Server and the MID WebService Event Listener has a Status of "Started".

# External Testing of the MID Server Configuration

ScienceLogic recommends that you test the MID Server connection by using an external testing source outside of ServiceNow, PowerFlow, and SL1.

1. Post a message to `http://{MID_SERVER_IP}:{MID_Web_Server_port}/api/mid/em/jsonv2`
2. Example body:

```
{
  "records":
  [
    {
      "source" : "Simulated",
      "event_class": "ScienceLogic",
      "node" : "Postman",
      "type" : "High Virtual Memory",
      "resource" : "C:",
      "severity" : "2",
      "description" : "Test Event",
      "ci_type": "cmdb_ci_app_server_tomcat",
      "message_key": "Postman_109843242",
      "additional_info": {"name": "Create an event in snow"}
    }
  ]
}
```

**IMPORTANT:** The value of the **Source Instance** (event\_class) field must be the same case-sensitive value used in the Connector Instance **Name**. If the values do not match exactly, the bi-directional connection will not work. In the example above, "ScienceLogic" is the **Source Instance** (event\_class) name. For more information, see [Configuring the Connector Instances](#).

3. Verify that the Send resulted in an **HTTPS Status 200**.

---

## Using the MID Server Script Include (ScienceLogic\_JS) in ServiceNow

The MID Server Script Include is provided with the "ScienceLogic SL1: Event Automation" application (also called the Certified Application), and it requires the ServiceNow Event Management plugin (`com.glideapp.itom.snac`). You can request the ServiceNow Event Management plugin directly from ServiceNow.

**NOTE:** For information about installing the Certified application, see [Installing the "ScienceLogic SL1: Event Integration Application" in ServiceNow](#).

The MID Server Script Include contains the following main parts:

- Test Connection
- Execute
- Update Source

**Test Connection** is for validating that setup is complete for returning delta changes back to the source instance.

The Test Connection process includes the following steps:

1. The Initialize step pulls in the required functions and defines default variables.
2. The Test Connection is a two-part requirement that checks for the application and configuration availability:
  - Validates Application is available via GET HTTP request to PowerFlow.
  - Validates Configuration is available via Get HTTP request to PowerFlow.
3. For the Logs step, because the script is run on the MID Server, all logs are submitted to **ms.log()**.

**Execute:** The part of the Script is currently is not in use, but it runs the same process as test Connection step. At this time the execute step does not pull down events from ScienceLogic with the MID Server Script Include. Events are delivered using a push methodology to the MID Server Listener.

**Update Source:** Picks up pending updates on the Connector Update Queues (**em\_connector\_update\_queue**) table and sends them back to the configured source instance.

The Update Source process includes the following steps:

1. The Initialize step pulls in the required functions and defines default variables.
2. Builds the URL.
3. Validates the URL.
4. Pulls all Records matching even\_class, source instance and connector Instance name sitting in pending.
5. For each record, checks to see if the record matches the following criteria:
  - **New:** Checks the **Number** field being null and a value being assigned.
  - **Open:** Checks for field change on the **State** field from Closed to a new value of Reopen or Open.
  - **Closed:** Checks for field change on the **State** field from Open or Reopen to a new value of Closed.
  - **Acknowledge:** Due the difference in how acknowledgments are handled in the two platforms, the Acknowledged criteria tracks the boolean value flipping to true and will return either the default ScienceLogic user\_id of 1 or a defined user id.
6. Matching values are written to new JSON code.
7. Matching JSON code is validated to ensure that it has information that needs to be sent back to source.
8. Posts the Request back to PowerFlow.
9. For the Logs step, because the script is run on the MID Server, all logs are submitted to **ms.log()**.

---

## Installing the "ScienceLogic SL1: Event Integration" (Scoped) Application in ServiceNow

The *ServiceNow Events Synchronization PowerPack* uses the "ScienceLogic SL1: Event Integration" application (also called the Scoped or Certified application) to sync event status updates from ServiceNow back to SL1. You must install the "ScienceLogic SL1: Event Integration" application on your ServiceNow instance to enable this Synchronization PowerPack.

**WARNING:** The "ScienceLogic SL1: Event Integration" application requires that you have already installed the ServiceNow Event Management plugin on the target ServiceNow instance. You can request this plugin directly from ServiceNow. Also, the MID Server must be configured.

**NOTE:** You need to have a ServiceNow HI Service Account to request this application and download it onto your ServiceNow instance.

You first request the "ScienceLogic SL1: Event Integration" application from the ServiceNow Store, and then you can install it.

To request and install the "ScienceLogic SL1: Event Integration" application:

1. Go to the ServiceNow Store at <https://store.servicenow.com> and search for "ScienceLogic SL1".
2. Select the "ScienceLogic SL1: Event Integration" application. The detail page for the application appears.
3. Click the **[Get]** button and log in with your HI credentials.
4. After the request is approved, log in to ServiceNow as an administrator and navigate to **Application Manager** (System Applications > Applications or My Company Applications).
5. Click **[Downloads]** in the menu header or search for "ScienceLogic".
6. Click the version drop-down for the "ScienceLogic SL1: Event Integration" application listing to make sure you are using the correct version of the application that is compatible with your version of this Synchronization PowerPack.
7. Click the **[Install]** button for the "ScienceLogic SL1: Event Integration" application. The installation is complete when the button changes to **[Installed]**.
8. In the filter navigator, search for "ScienceLogic" and locate the application in the left-hand navigation menu to verify that the application was installed.

**NOTE:** You might need to log out of ServiceNow and log back in to see the updated left-hand navigation menu.

---

## Configuring the Connector Definitions in ServiceNow

To configure the Connector Definitions used by the Update Sender transaction:

1. Navigate to **Event Management > Event Connectors (Pull) > Connector Definitions**. The **Connector Definitions** page appears.
2. Click **[New]** to create a new Connector Definition.

**CAUTION:** When you create a Connector Definition, ServiceNow creates a template MID Server Script Include with the same name and "\_JS" appended at the end of the name. This item is automatically attached to the new record in the **JavaScript to run** field after you click **[Submit]**.

3. In the **Name** field, type a unique name and click **[Submit]** to save the new Connector Definition record. The **Connector Definitions** page appears:

The screenshot shows the 'Connector Definition' form for 'Sciencelogic'. The form includes the following fields and sections:

- Name:** Sciencelogic
- Script type:** Javascript
- JavaScript to run:** Sciencelogic\_JS
- Default schedule (seconds):** 30
- Bi-directional:**
- Alert field identifier:** Message key
- Collect metrics:**

**Connector Parameters** (Table with 5 rows):

Name
application_path
configuration_path
log_level
run_path
sl1_userid

**Connector Definition to MID Server Capabilities** (Table with 1 row):

MID server capability
Insert a new row...

Buttons: Update, Delete

4. Open the Connector Definition you just created and complete the following fields:
  - **Javascript to run.** Attach the JavaScript file provided by the Certified application: [ScienceLogic SL1: Event Integration](#).
  - **Default schedule (seconds).** Specify the time in seconds between retrieval of events, such as "120". This field is not required for this integration specifically, but it is a required field. Events will not be pulled when this is triggered.
  - **Bi-Directional.** Select this option to enable ServiceNow to send Alert changes back to the source instance. Enabling this allows SL1 as an external monitoring system to receive changes made in ServiceNow that are specific to Alerts.
  - **Alert field identifier.** Set to "Message Key". The field causes the source monitoring system to be updated.
5. In the **Connector Parameters** section, double-click to add one or more rows using the following parameters to enable correct formatting and communication with the source event system:

Name	Example	Required
application_path	/api/v1/applications/update_sl1_event_from_snow_trigger	No
configuration_path	/api/v1/configurations/ + Configuration Name	Yes
log_level	30 (Default Log level)	No
run_path	/api/v1/applications/run	No
sl1_userid	1 (Default user_id in SL1)	No

**NOTE:** The entries that are marked as not required are supplied by default.

6. Click **[Submit]** to save the updated Connector Definition.

---

## Configuring the Connector Instance in ServiceNow

Before you can set up a Connector Instance in ServiceNow, you need to create a ServiceNow credential that will be used by the Connector Instance.

### Creating a ServiceNow Credential

To configure the ServiceNow credential that will be used by the Connector Instance:

1. Navigate to **Connections & Credentials > Credentials**. The **Credentials** page appears.
2. Click **[New]**.
3. Select **Basic Auth Credentials**. A new **Basic Auth Credentials** record appears.
4. Complete the following fields on the new record:

- **Name.** Type a unique name for the credential. Required.
  - **User name.** Type the ServiceNow user name.
  - **Password:** Type the ServiceNow password.
5. Click **[Submit]** to save the new record.
  6. After the record is saved, open it again and check the **Active** field on the record.
  7. Click **[Update]**.

## Configuring the Connector Instance

To configure the Connector Instance:

1. Navigate to **Event Management > Event Connectors (Pull) > Connector Instances**.
2. Click **[New]** and complete the following fields on the new record:
  - **Name**. Type a unique name. Required.

**WARNING:** The value of the Connector Instance **Name** must be the same case-sensitive value used in the **Source Instance** (event\_class) field. If the values do not match exactly, the bi-directional connection will not work. In the example below, "ScienceLogic" is the Connector Instance Name.

- **Connector definition**. Confirm that the Connector Definition you created is associated with this Connector Instance record.
- **Host IP**: Specify the host IP address for PowerFlow.
- **Credential**. Select the credential for connection to PowerFlow. For more information, see [Configuring the ServiceNow Credential](#).
- **Bi-directional**. Select this option.

The screenshot shows the configuration page for a Connector Instance named 'ScienceLogic'. The page includes the following fields and values:

- Name:** ScienceLogic
- Active:**
- Connector definition:** ScienceLogic
- Host IP:** 10.2.11.77
- Credential:** IS 11.77
- Event collection last run time:** 2020-07-09 06:42:00
- Last event collection status:** Success
- Event collection schedule (seconds):** 30
- Bi-directional:**
- Last bi-directional status:** -- None --
- Last error message:** (Empty text area)

At the bottom, there is a table titled 'Connector Instance Values' with the following data:

Name	Value
application_path	/api/v1/applications/update_sl1_event_fr...
configuration_path	/api/v1/configurations/qa_config

3. In the **Connector Instance Values** section, ensure that the values have been configured:

Name	Example	Required
application_path	<code>/api/v1/applications/update_sl1_event_from_snow_trigger</code>	No
configuration_path	<code>/api/v1/configurations/</code> + Configuration Name	Yes
log_level	<b>30</b> (Default Log level)	No
run_path	<code>/api/v1/applications/run</code>	No
sl1_userid	<b>1</b> (Default user_id in SL1)	No

4. In the **MID Servers for Connectors** section, select the MID Server.
5. Click **[Submit]** to save the new record.
6. After the record is saved, open it again and click **[Test Connector]** to confirm the correct configuration. This option is only available after you submit the record.
7. If you have a successful test connection, check the **Active** field on the record.
8. Click **[Update]**.

---

## Creating a ServiceNow Credential in SL1

To configure SL1 to communicate with ServiceNow, you must first create a SOAP/XML credential. This credential allows the Run Book Automation scripts in the *ServiceNow Base Pack PowerPack* to connect with your ServiceNow instance.

The **ServiceNow RBA - Example** credential from the *ServiceNow Base Pack PowerPack* is an example SOAP/XML credential that you can configure for your own use.

To configure the **ServiceNow RBA - Example** credential:

1. In SL1, go to the **Credential Management** page (System > Manage > Credentials).
2. Locate the **ServiceNow RBA - Example** credential and click its wrench icon (🔧). The **Edit SOAP/XML Credential** page appears:

The screenshot shows the 'Credential Editor' window for 'Edit SOAP/XML Credential #85'. The window is divided into several sections:

- Basic Settings:** Profile Name (ServiceNow RBA - Example), Content Encoding ([ text/xml ]), Method ([ POST ]), HTTP Version ([ HTTP/1.1 ]), URL [ http(s)://Host:Port/Path | %D = Aligned Device Address | %N = Aligned Device Host Name ] (https://INTEGRATIONSERVICEHOSTNAME), HTTP Auth User (USERNAME), HTTP Auth Password (\*\*\*\*\*), Timeout (seconds) (5).
- Proxy Settings:** Hostname/IP, Port (0), User.
- CURL Options:** A list of options including CAINFO, CAPATH, CLOSEPOLICY, CONNECTTIMEOUT, COOKIE, COOKIEFILE, COOKIEJAR, COOKIELIST, CRLF, CUSTOMREQUEST, and DNSCACHETIMEOUT.
- Soap Options:** Embedded Password [%P], Embed Value [%1], Embed Value [%2], Embed Value [%3], Embed Value [%4].
- HTTP Headers:** + Add a header.

Buttons for 'Save' and 'Save As' are located at the bottom of the window.

3. Complete the following fields:
  - **Profile Name.** Type a new name for the ServiceNow credential.
  - **Content Encoding.** Make sure *text/xml* is selected.
  - **Method.** Make sure *POST* is selected.
  - **HTTP Version.** Select *HTTP/1.1*.
  - **URL.** Type the URL for your PowerFlow instance.
  - **HTTP Auth User.** Type the username of your PowerFlow instance.
  - **HTTP Auth Password.** Type the password of your PowerFlow instance.
  - **Timeout.** Type "5".
4. Click **[Save As]**.
5. When the confirmation message appears, click **[OK]**.

- On the **Credential Management** page (System > Manage > Credentials), make a note of the value in the **ID** column for the credential you just created:

Profile Name	Organization	RO Use	RW Use	DA Use	Type	Credential User	Host	Port	Timeout (ms)	ID	Last Edited	Edited By
ServiceNow RBA - Example	[all orgs]	--	--	--	SOAP/XML Host USERNAME	INTEGRATIONSERVICEHOSTNAME		443	5000	107	2019-07-15 11:10:54	em7admin

You will use this value with the `sl1_credential_id` parameter when you *enable the snippet code of the "ServiceNow: Add/Update/Clear Event" Run Book Action Policy*:

**Policy Editor | Editing Action [58]** Reset

Action Name: ServiceNow: Add/Update/Clear Event Action State: Enabled

Description: Adds and Updates Events in ServiceNow.

Organization: [ System ] Action Type: ServiceNow: Create, Update, Clear Ticket (1.2)

Execution Environment: [ --Default: ServiceNow Base Pack ] Action Run Context: [ Database ]

Input Parameters:

```
{
  "sl1_credential_id": "101",
  "debug": false,
  "configuration": "docs_config",
  "queue": "",
  "integration": "events",
  "discard_if_no_ci": false
}
```

Save Save As

## Enabling the Run Book Automation Policies in SL1

Before you can run the "ServiceNow: Add/Update/Clear Event" Run Book Action, you must enable the three related Run Book Automation policies in SL1:

- ServiceNow: [Events] - Add/Update
- ServiceNow: [Events] - Event Acknowledged
- ServiceNow: [Events] - Event Cleared

To enable the three ServiceNow Run Book Automation policies:

1. In SL1, go to the **Automation Policy Manager** page (Registry > Run Book > Automation).
2. Locate the "ServiceNow: [Events] Add/Update" automation policy and click its wrench icon (🔧). The **Automation Policy Editor** page appears:

The screenshot shows the 'Automation Policy Editor' interface for editing a policy named 'ServiceNow: [Events] - Add/Update'. The 'Policy State' is set to 'Enabled' and the 'Policy Priority' is set to 'High'. The 'Repeat Time' is set to 'Only once' and 'Align With' is set to 'Devices'. The 'Aligned Actions' list contains one item: '1. ServiceNow: Create, Update, Clear Incident or Event'. The 'Available Devices' list includes '50C\_Azure\_Com' and various Microsoft Azure services. The 'Available Events' list includes several critical alerts from AKCP. The 'Available Actions' list includes various snippets for automation utilities and AWS services.

3. Update the following fields:
  - **Policy State.** Select *Enabled*.
  - **Policy Priority.** Select *High* to ensure that this PowerFlow automation policy is added to the top of the queue.
  - **Available Actions.** If it is not already selected, select the corresponding ServiceNow Run Book Action policy and add it to the **Aligned Actions** column.

**WARNING:** ScienceLogic highly recommends that you do not make changes to the **Policy Type, Repeat Time, or Align With** fields or the *And event is NOT acknowledged* setting.

4. Click **[Save]**.
5. Repeat steps 2-4 for the "ServiceNow: Event Acknowledged" and "ServiceNow: Event Cleared" Run Book Automation policies.

## Enabling and Customizing the Run Book Action Policy

The "ServiceNow: Add/Update/Clear Event" Run Book Action policy contains several default values in the snippet code for the policy that you can customize to use with the *ServiceNow Events Synchronization PowerPack*.

You can edit these values in the **Input Parameters** pane of the **Action Policy Editor** page for this policy.

To enable and customize the Run Book Action policy:

1. In SL1, go to the **Action Policy Manager** page (Registry > Run Book > Actions).
2. Locate the **ServiceNow: Add/Update/Clear Event** policy and click its wrench icon (🔧). The **Action Policy Editor** page appears:

The screenshot shows the 'Policy Editor | Editing Action [58]' window. The 'Action Name' is 'ServiceNow: Add/Update/Clear Event' and the 'Action State' is 'Enabled'. The 'Description' is 'Adds and Updates Events in ServiceNow.'. The 'Organization' is '[ System ]' and the 'Action Type' is 'ServiceNow: Create, Update, Clear Ticket (1.2)'. The 'Execution Environment' is '[ -- Default: ServiceNow Base Pack ]' and the 'Action Run Context' is '[ Database ]'. The 'Input Parameters' section contains the following JSON snippet:

```
{
  "sli_credential_id": "101",
  "debug": false,
  "configuration": "docs_config",
  "queue": "",
  "integration": "events",
  "discard_if_no_ci": false
}
```

At the bottom of the editor are 'Save' and 'Save As' buttons.

3. For the **Action State** field select *Enabled*.
4. In the **Input Parameters** pane, edit the snippet code as necessary, using the information in the **Customizing the Snippet Code in the Input Parameters Pane** section, below. When you are finished, click **[Save]**.

## Customizing the Snippet Code in the Input Parameters Pane

SL1 Run Book Action snippets are written in Python. In the event of a syntax error, the policies will no longer run. As a result, you must ensure that all edits adhere to Python standards. True and False options are case-sensitive and must not contain quotes.

**NOTE:** Previous SyncServer users had three separate Run Book Action scripts for add/update, acknowledge, and clear. These have been rolled into a single Run Book Action in this Synchronization PowerPack, but there are still three Automation policies.

You can customize the following values in the "ServiceNow: Add/Update/Clear Incident" Run Book Action snippet code:

- **sl1\_credential\_id**. Specifies the ID of the credential object. You can find this value in the **ID** column of the **Credentials** page (System > Manage > Credentials of SL1). For example: "sl1\_credential\_id": "101"
- **debug**. A true/false value that determines if the action is logged in SL1 and if the application is run in Debug Mode on PowerFlow. Troubleshooting logs are written to **/data/tmp/servicenow\_rba.log**.
- **configuration**. Specifies the ID of the configuration object used on PowerFlow. The configuration ID is all lower-case, with spaces in the configuration object "friendly" name replaced by underscores. For example: "configuration": "docs\_configs".

**NOTE:** To find the configuration ID with the PowerFlow API, make a GET request on this endpoint:  
[https://<PowerFlow\\_service\\_hostname>/api/v1/configurations](https://<PowerFlow_service_hostname>/api/v1/configurations).

- **queue**. Specifies the worker queue on which the application runs. Leave this as default.
- **discard\_if\_no\_ci**. Specifies whether PowerFlow should create incidents in ServiceNow for devices that do not have a matching CI record. The default is *false*. Your options include:
  - *true*. If a device is not mapped to a CI, PowerFlow will *not* create an incident in ServiceNow, and SL1 is not updated. The following log message appears: "No CI found".
  - *false*. If a device is not mapped to a CI, PowerFlow *will* create an incident in ServiceNow and update SL1.

## Customizing Logging in the Run Book Action

You can customize the following logging-related items in the "ServiceNow: Add/Update/Clear Event" Run Book Action snippet code:

- `logfile = /data/tmp/ServiceNow_add_update_clear_incident.log`
  - Location for logging output.
  - Will be created if it does not exist.

- Will be appended with each Run Book job.
- Is case-sensitive.
- `do_debug_logging = True`
  - True is on, False is off.
  - Is case-sensitive.
  - For troubleshooting, these can be enabled or changed.
  - Writes logs to `/data/tmp/servicenow_rba.log`.

---

## Sending Custom Data to ServiceNow Using the Passthrough Option

You can use the "ServiceNow: [Events] - Add/Update" Run Book Automation and the "ServiceNow: Add/Update/Clear Event" Run Book Action to "pass through" custom data about events to ServiceNow.

To pass custom data to ServiceNow:

- Create a new Run Book Action that pulls the relevant data and adds it to a dictionary called `EM7_RESULT`.
- Add the new Run Book Action to the "ServiceNow: [Events] - Add/Update" Run Book Automation Policy, ahead of the "ServiceNow: [Events] - Add/Update/Clear Event" Run Book Action so that the new Action runs first, and then is consumed by the ServiceNow Action.

The following procedure describes how to configure the passthrough functionality.

## Passing Custom Data to ServiceNow

To pass custom data to ServiceNow:

1. In SL1, go to the **Action Policy Manager** page (Registry > Run Book > Actions) and click **[Create]** to create a new Run Book Action policy:

The screenshot shows the 'Policy Editor | Creating New Action' interface. It features a 'Reset' button in the top right corner. The form is divided into several sections:

- Action Name:** Example Passthrough EM7\_RESULT
- Action State:** [Enabled]
- Description:** Passthrough data using EM7\_RESULT dictionary
- Organization:** [System]
- Action Type:** Run a Snippet
- Snippet Credential:** (None)
- Action Run Context:** Database
- Execution Environment:** [-- Default Environment]
- Snippet Code:** EM7\_RESULT = {"work\_notes": "This is a new note"}

A 'Save' button is located at the bottom center of the form.

2. Complete the following fields:
  - **Action Name.** Type a unique name for the Action.
  - **Action State.** Select *Enabled*.
  - **Action Type.** Select *Run a Snippet*.
  - **Execution Environment.** Select *ServiceNow Base Pack*.
  - Complete the other fields as needed.

3. In the **Snippet Code** pane, add the snippet code you want to include for the EM7\_RESULT dictionary. For example, the following snippet code lets you override the ServiceNow Event work notes with a hardcoded note:

```
EM7_RESULT = {"work_notes": "This is a new note"}
```

Additional notes about the structure of the EM7\_RESULT dictionary:

- EM7\_RESULT = is required for the dictionary, and the formatting of the keys should match the example above.
  - All keys defined in the EM7\_RESULT dictionary need to map to field IDs on the **ScienceLogic Events** table in ServiceNow.
  - You can hard-code the values in the EM7\_RESULT dictionary, or you can use variables and functions, like the "Snippet Code Example", below.
  - As a best practice, avoid sending null passthrough values to ServiceNow. If you must send 'null' or 'NULL' values to ServiceNow, pass through that value as an empty string, such as "location": "". Also, only pass through values that you need. For example, instead of sending {"location": "", "work\_notes": "stuff"}, simply send {"work\_notes": "stuff"}.
  - A long snippet might delay the ticket being created
4. Click **[Save]**.
  5. Go to the **Automation Policy Manager** page (Registry > Run Book > Automation) and open the "ServiceNow: [Events] - Add/Update" Run Book Automation Policy.

- In the **Available Actions** section, add the new Run Book Action *before* the "ServiceNow: Create, Update, Clear Event" Run Book Action:

The screenshot shows the 'Automation Policy Editor' for 'Editing Automation Policy [43]'. The interface includes fields for Policy Name, Policy Type, Policy State, Policy Priority, and Organization. Below these are sections for Criteria Logic, Match Logic, and Match Syntax. The 'Available Actions' section is highlighted with a red box, showing a list of actions including 'Snippet [5]: Example Passthrough EM7\_RESULT' and 'Snippet [5]: ServiceNow: Create, Update, Clear Incident [100]; Se'. The 'Aligned Actions' section shows the same two actions in order.

**NOTE:** The output of this new Run Book Action will be consumed by the "ServiceNow: Create, Update, Clear Event" Run Book Action, ensuring that the EM7\_RESULT dictionary is passed through to ServiceNow. The "ServiceNow: Create, Update, Clear Event" Run Book Action automatically populates the passthrough values with any values from EM7\_LAST\_RESULT. The passthrough overwrites any other previously defined fields, such as assignment group.

- You can add additional Run Book Actions to the Run Book Automation Policy for any additional workflows that you might want to run. The Automation Policy execute these Actions in a sequential, top-down order. However, the "ServiceNow: Create, Update, Clear Event" Run Book Action only consumes the EM7\_RESULT dictionary from the Run Book Action directly above it.

# Configuring the "ServiceNow: [Events] - Click to Create" Automation Policy

The "ServiceNow: [Events] - Click to Create" Run Book Automation policy lets you manually create an alert in ServiceNow by clicking the **Actions** button ( --- ) in SL1 for an event and selecting "Create External Ticket" (or by clicking the life-preserver icon ( 🛟 ) for an event in the classic user interface).

This policy is available in the *ServiceNow Base Pack PowerPack* version 104 or later.

To configure the "ServiceNow: [Events] - Click to Create" policy:

1. In SL1, go to the Behavior Settings page (System > Settings > Behavior) and set the **Event Console Ticket Life Ring Button Behavior** option to *Create/View External Ticket*.
2. Click **[Save]** to save your changes.
3. Go to the **Automation Policy Manager** page (Registry > Run Book > Automation).
4. Locate the **ServiceNow: [Events] - Click to Create** policy and click its wrench icon ( 🛠 ). The **Automation Policy Editor** page appears:

The screenshot shows the 'Automation Policy Editor' for 'ServiceNow: [Events] - Click to Create'. The interface includes several sections:

- Policy Settings:** Policy Name (ServiceNow: [Events] - Click to Create), Policy Type ([ Active Events ]), Policy State (Enabled), Policy Priority ([ Default ]), and Organization ([ System ]).
- Criteria Logic:** [ Severity >= ] [ Minor, ], [ and no time has elapsed ], [ since the first occurrence, ], and event is NOT cleared, [ and all times are valid ], MOSS schedule - end data 6/1/2020, and a checkbox for Trigger on Child Rollup.
- Match Logic:** [ Text search ]
- Match Syntax:** Repeat Time (Every 30 seconds until satisfied) and Align With ([ Devices ]).
- Available Devices:** A list of devices including 50C\_Azure\_Com, Microsoft: Azure Active Directory Tenant: Default Directory, Microsoft: Azure App Service: eastus Apps, Microsoft: Azure App Service Plan: eastus appsvc\_asp\_Wii, Microsoft: Azure DNS Service: DNS Services, and Microsoft: Azure DNS Zone: 50centos.net.
- Aligned Devices:** (All devices)
- Available Events:** A list of events including [3017] Critical: AKCP: AC Voltage sensor detects no current, [3026] Critical: AKCP: DC Voltage sensor High Critical, [3027] Critical: AKCP: DC Voltage sensor Low Critical, [3016] Critical: AKCP: Dry Contact Sensor Low Critical, [3022] Critical: AKCP: Smoke Detector Alert, [3020] Critical: AKCP: Water Sensor has detected water, and [1024] Critical: AKCP: Diagnostic Test Failed.
- Aligned Events:** (All events)
- Available Actions:** A list of actions including Snippet [10]: SL1 Event Trap, Snippet [5]: Automation Utilities: Calculate Memory Size for E, Snippet [5]: AWS: Disable Instance By Tag, Snippet [5]: AWS: Discover from EC2 IP, Snippet [5]: AWS: Get EC2 Instance Configuration, Snippet [5]: AWS: Merge Physical with Component, and Snippet [5]: AWS: Resize Device Class Alignment.
- Aligned Actions:** 1. ServiceNow: Create, Update, Clear Incident or Event

Buttons for 'Save' and 'Save As' are located at the bottom of the editor.

5. Update the following fields:
  - **Policy State.** Select *Enabled*.
  - **Repeat Time.** Specify the frequency at which SL1 should execute the automation policy while the conditions are still met. The choices range from "every 30 seconds until satisfied" to "every 2 hours until satisfied", or "only once". By default, the policy only runs once.
  - **Available Actions.** If it is not already selected, select the corresponding ServiceNow Run Book Action policy to add it to the **Aligned Actions** field.
6. Click **[Save]**.

---

## Creating and Aligning a Configuration Object in PowerFlow

A **configuration object** supplies the login credentials and other required information needed to execute the steps for a PowerFlow application. The **Configurations** page (  ) of the PowerFlow user interface lists all available configuration objects for that system.

You can create as many configuration objects as you need. A PowerFlow application can only use one configuration object at a time, but you can use (or "align") the same configuration object with multiple applications.

To use this Synchronization PowerPack, you will need to use an existing configuration object in the PowerFlow user interface or create a new configuration object. Next, you need to align that configuration object to the relevant applications that are triggered by the Run Book Actions in SL1.

**TIP:** Depending on your SL1 environment and the third-party environment with which you are syncing data, you might be able to use the same configuration object with more than one Synchronization PowerPack.

## Creating a Configuration Object for Event Sync

For the ServiceNow Events Synchronization PowerPack, you will need to make a copy of the "ServiceNow SyncPack" configuration object, which is the sample configuration file that was installed with the *ServiceNow Base Synchronization PowerPack*. After you create the new configuration object, you will need to add specific name-value pairs as variables for this Synchronization PowerPack. These variables are listed in the following procedure.

**TIP:** If you have already set up a configuration object that you are using for other ServiceNow Synchronization PowerPacks, you can use that configuration object for Event Sync. Go to step 7 in the following procedure to add the variables needed for this Synchronization PowerPack.

To create a configuration object for the Events Synchronization PowerPack:

1. In the PowerFlow user interface, go to the **Configurations** page (⚙️).
2. Click the **[Actions]** button (⋮) for the "ServiceNow SyncPack" configuration object and select *Edit*. The **Configuration** pane appears.
3. Click **[Copy as]**. The **Create Configuration** pane appears:

Name	Value	Encrypted	
sl1_host	em7.sciencelogic.com	<input type="checkbox"/>	X
sl1_password	SVh9nTCUEffef1edepEIJW8NrgF	<input checked="" type="checkbox"/>	X
sl1_user	em7admin	<input type="checkbox"/>	X
sl1_db_host	\${config.sl1_host}	<input type="checkbox"/>	X
sl1_db_user	root	<input type="checkbox"/>	X
sl1_db_password	IDPx5lwLIX5HOQzsg6nil4FpSgc	<input checked="" type="checkbox"/>	X
snw_host	sciencelogic.service-now.com	<input type="checkbox"/>	X

4. Complete the following fields:
  - **Friendly Name**. Name of the configuration object that will display on the **Configurations** page.
  - **Description**. A brief description of the configuration object.
  - **Author**. User or organization that created the configuration object.
  - **Version**. Version of the configuration object.
5. Click **[Toggle JSON Editor]** to show the JSON code.
6. In the **Configuration Data** field, be sure to include the required block of code to ensure that the applications aligned to this configuration object do not fail:

```
{  
  "encrypted": false,  
  "name": "sl1_db_host",  
  "value": "${config.sl1_host}"  
}
```

For example:

```
{
  "encrypted": false,
  "name": "sl1_db_host",
  "value": "10.2.11.42"
}
```

**NOTE:** If you are using SL1 with an External Database (SL1 Extended architecture or a cloud-based architecture), update the "value" of that block of code to be the host of your database. This field accepts IP addresses. For example: "value": "db.sciencelogic.com". If you are *not* using the SL1 Extended architecture or a cloud-based architecture, you do not need to make any changes to the block of code other than pasting the code into the configuration object.

7. In the **Configuration Data** field, update the default name-value pairs or add your own to match your PowerFlow configuration. The Events Synchronization PowerPack requires the following name-value pairs or variables:
  - **snow\_host**. The URL for the target ServiceNow instance. For example: **sciencelogic.service-now.com**.
  - **snow\_event\_class**. Unique identifier for the PowerFlow host that specifies which PowerFlow host should receive updates from ServiceNow. For bi-directional functionality to work, the connector instance name needs to match the source instance (**snow\_event\_class**) field exactly. These fields are case sensitive.
  - **mid\_server\_host**. The IP address of the ServiceNow MID Server, along with the port number of the listener. In ServiceNow, go to the **MID Web Server Contexts** page (MID Server > Extensions > MID Web Server) and select the record you are using for Event Sync. The port number is defined in the **HTTP/HTTPS Port** field (port\_number) on the **MID Web Server Context** record form. For example: **192.168.1.1:1773**.
  - **mid\_server\_user**. The MID Server user account. In ServiceNow, go to the **MID Web Server Contexts** page (MID Server > Extensions > MID Web Server) and select the record you are using for Event Sync. The user is defined in the **Basic Auth User** field (basic\_auth\_user) on the **MID Web Server Context** record form.
  - **mid\_server\_password**. The MID Server account password. In ServiceNow, go to the **MID Web Server Contexts** page (MID Server > Extensions > MID Web Server) and select the record you are using for Event Sync. The password is defined in the **Basic Auth User Password** field (basic\_auth\_user\_password) on the **MID Web Server Context** record form. This is not a User on the sys\_user table.
  - **region**. Unique identifier that identifies your SL1 instance within ServiceNow.
  - **sl1\_host**. The URL or IP address for the target SL1 system.
  - **sl1\_user**. User id of the user account the PowerFlow will use to log in to SL1.
  - **sl1\_password**. Password for the user account that PowerFlow will use to log in to SL1.
8. Click **[Save]**. You can now [align the new configuration object](#) with the following PowerFlow applications:

- Create Events in ServiceNow from SL1 Event
- Update SL1 Event from ServiceNow Trigger

The following code is an example of the JSON configuration data for this configuration object:

```
[
  {
    "encrypted": false,
    "name": "mid_server_host",
    "value": ""
  },
  {
    "encrypted": false,
    "name": "mid_server_user",
    "value": ""
  },
  {
    "encrypted": false,
    "name": "region",
    "value": ""
  },
  {
    "encrypted": true,
    "name": "mid_server_password",
    "value": ""
  },
  {
    "encrypted": false,
    "name": "sl1_host",
    "value": ""
  },
  {
    "encrypted": true,
    "name": "sl1_password",
    "value": ""
  },
  {
    "encrypted": false,
    "name": "sl1_user",
    "value": ""
  },
  {
    "encrypted": false,
    "name": "snow_host",
    "value": ""
  },
  {
    "encrypted": false,
    "name": "snow_event_class",
    "value": ""
  },
  {
    "encrypted": false,
    "name": "mid_rel_url",
    "value": "/api/mid/em/jsonv2"
  }
]
```

```
}  
]
```

## Aligning a Configuration Object

To run Event Sync, you must "align" the configuration object to run with the following PowerFlow applications:

- Create Event in ServiceNow from SL1 Event
- Update SL1 Event from ServiceNow Trigger

**WARNING:** Do not manually run or schedule these applications. These applications should only be triggered by Run Book Automations in SL1 or by the ServiceNow MID Server.

**NOTE:** If you want to link events with ServiceNow Configuration Items (CIs), you will need to run the "Sync Devices from SL1 to ServiceNow" application from the *ServiceNow CMDB Synchronization PowerPack*. If this is the first time you are running Case Sync, you will need to run the "Sync Devices from SL1 to ServiceNow" application twice to build the internal cache. For more information, see the *ServiceNow CMDB Synchronization PowerPack* manual.

To align the configuration object with the relevant applications:

1. On the **Applications** page of the PowerFlow user interface, open an application and click **[Configure]** (  ). The **Configurations** pane for that application appears:

2. From the **Configurations** drop-down, select the configuration object you want to use.
3. Click **[Save]** to align that configuration with the application.
4. Wait until you see the "App & Config modifications saved" pop-up message before proceeding.
5. Repeat this process for the two remain applications.

**NOTE:** The values for **eventDetails** and the other parameters that appear in the **Configuration** pane with a padlock icon (  ) are populated either by the configuration object you aligned with the application or by the Run Book Action. Do not modify these values. If you encounter an error, make sure your Run Book Action is configured properly.

## Troubleshooting the Events Synchronization PowerPack

---

### Overview

This chapter includes troubleshooting resources and procedures to use with the ServiceNow *Events Synchronization PowerPack*.

This chapter covers the following topics:

<i>Initial Troubleshooting Steps</i> .....	45
<i>Troubleshooting Event Delivery and Update Sender Transactions</i> .....	45
<i>Resources for Troubleshooting</i> .....	48

---

## Initial Troubleshooting Steps

PowerFlow acts as a middle server between data platforms. For this reason, the first steps should always be to ensure that there are no issues with the data platforms with which PowerFlow is talking. There might be additional configurations or actions enabled on ServiceNow or SL1 that result in unexpected behavior. For detailed information about how to perform the steps below, see [Resources for Troubleshooting](#).

### SL1 PowerFlow

1. Run `docker service ls` on the PowerFlow server.
2. Note the Docker container version, and verify that the Docker services are running.
3. If a certain service is failing, make a note the service name and version.
4. If a certain service is failing, run `docker service ps <service_name>` to see the historical state of the service and make a note of this information. For example: `docker service ps iservices_contentapi`.
5. Make a note of any logs impacting the service by running `docker service logs <service_name>`. For example: `docker service logs iservices_couchbase`.

### ServiceNow

1. Make a note of the ServiceNow version and Synchronization PowerPack version, if applicable.
2. Make a note of whether the user is running an update set or a version of the Certified/Scoped application for a Synchronization PowerPack, if relevant.
3. Make a note of the Synchronization PowerPack application that is failing on PowerFlow.
4. Make a note of what step is failing in the application, try running the application in debug mode, and capture any traceback or error messages that occur in the step log.

---

## Troubleshooting Event Delivery and Update Sender Transactions

There are two distinct parts to troubleshooting this Synchronization PowerPack as a result of the two different transaction methods for **Event Delivery** and **Update Sender**.

## Troubleshooting the Event Delivery Transaction

To aid with troubleshooting, enable the debug flag in the "ServiceNow: Add/Update/Clear Event" Run Book Action in SL1. See the *Automation* step in the following diagram:

Changing the flag in the **Input Parameters** section to "debug": `true`, will allow for additional logging in the SyncPack step, because the SyncPack application is triggered, not scheduled. Enabling the debug flag in the Run Book Action expands the debug logging in the SyncPack.

**NOTE:** There is no return information other than the HTTP status on a submit to the MID Server Instance when delivering event payloads.

Logging at the *MID Server* step is handled by JSON that is run via the URL used. By default, the Event integration uses the provided ServiceNow generic JSON.

For more information, see:

- [Send events via web service](#)
- [Event collection via MID using push](#)
- [Configure em context extension](#)

## Troubleshooting the Update Sender Transaction

You can configure connector parameters with a specific log level to allow for additional logging in the SyncPack step as well as in the MID Server logs. See the *ScienceLogic\_JS* step in the following diagram:

**NOTE:** The log level trigger is defined in the *Scienclologic\_JS* step because the Synchronization PowerPack application is triggered, not scheduled.

MID Server logs can be found on the MID Server in the **agent0.log.0** logs.

For more information, see:

- [Access MID Server Logs](#)
- [Troubleshooting a MID Server video](#)

## Resources for Troubleshooting

This section contains port information for PowerFlow and troubleshooting commands for Docker, Couchbase, and the PowerFlow API.

### Useful PowerFlow Ports

- <https://<IP of PowerFlow>:8091>. Provides access to Couchbase, a NoSQL database for storage and data retrieval.
- <https://<IP of PowerFlow>:15672>. Provides access to the RabbitMQ Dashboard, which you can use to monitor the service that distributes tasks to be executed by PowerFlow workers. Use *guest/guest* for the login.
- <https://<IP of PowerFlow>/flower>. Provides access to Flower, a tool for monitoring and administrating Celery clusters.

**NOTE:** For version 2.0.0 and later of PowerFlow, port 5556 must be open for both PowerFlow and the client.

### Helpful Docker Commands

PowerFlow is a set of services that are containerized using Docker. For more information about Docker, see the [Docker tutorial](#).

Use the following Docker commands for troubleshooting and diagnosing issues with PowerFlow:

### Viewing Container Versions and Status

To view the PowerFlow version, SSH to your PowerFlow instance and run the following command:

```
docker service ls
```

In the results, you can see the container ID, name, mode, status (see the *replicas* column), and version (see the *image* column) for all the services that make up PowerFlow:

```
[root@fsunis4lab ~]# docker service ls
ID                NAME                MODE                REPLICAS                IMAGE                PORTS
0vsmihuj5v301    iservices_gui        replicated           1/1                      repository.auto.sciencelogic.local:5000/is-gui:1.7.0    *:80->80/tcp,*:443->443/tcp
l0v9f1c1cmh3     iservices_redis      replicated           2/1                      redis:4.0.2
jms6h3ymuf        iservices_flower     replicated           1/1                      repository.auto.sciencelogic.local:5000/is-worker:1.7.0    *:5555->5555/tcp
hh3pt2l8lcaf     iservices_scheduler  replicated           1/1                      repository.auto.sciencelogic.local:5000/is-worker:1.7.0
nt1mltvq6xhx     iservices_contentapi  replicated           1/1                      repository.auto.sciencelogic.local:5000/is-api:1.7.0      *:5000->5000/tcp
cyln9qgsudmi     iservices_rabbitmq   replicated           1/1                      rabbitmq:3
klul9h8jst6e     iservices_visual     replicated           2/1                      dockersamples/visualizer:latest                          *:8081->8080/tcp
wcy398d8uuv      iservices_couchbase  replicated           1/1                      repository.auto.sciencelogic.local:5000/is-couchbase:1.7.0  *:8091->8091/tcp,*:8092->8092/tcp
f->8093/tcp,*:8094->8094/tcp,*:11210->11210/tcp
blbxatxz7uf      iservices_steprunner  replicated           5/5                      repository.auto.sciencelogic.local:5000/is-worker:1.7.0
```

## Restarting a Service

Run the following command to restart a single service:

```
docker service update --force <service_name>
```

## Stopping all PowerFlow Services

Run the following command to stop all PowerFlow services:

```
docker stack rm iservices
```

## Restarting Docker

Run the following command to restart Docker:

```
systemctl restart docker
```

**NOTE:** Restarting Docker does not clear the queue.

## Viewing Logs for a Specific Service

You can use the Docker command line to view the logs of any current running service in the PowerFlow cluster. To view the logs of any service, run the following command:

```
docker service logs -f iservices_<service_name>
```

Some common examples include the following:

```
docker service logs -f iservices_couchbase
docker service logs -f iservices_steprunner
docker service logs -f iservices_contentapi
```

**NOTE:** *Application* logs are stored on the central database as well as on all of the Docker hosts in a clustered environment. These logs are stored at **/var/log/iservices** for both single-node or clustered environments. However, the logs on each Docker host only relate to the services running on that host. For this reason, using the Docker service logs is the best way to get logs from all hosts at once.

## Clearing RabbitMQ Volume

RabbitMQ is a service that distributes tasks to be executed by PowerFlow workers. This section covers how to handle potential issues with RabbitMQ.

The following error message might appear if you try to run a PowerFlow application via the API:

```
Internal error occurred: Traceback (most recent call last):\n File \"./content_
api.py\", line 199, in kickoff_application\n task_status = ... line 623, in _on_
close\n (class_id, method_id), ConnectionError)\nInternalError: Connection.open:
(541) INTERNAL_ERROR - access to vhost '/' refused for user 'guest': vhost '/' is
down
```

First, verify that your services are up. If there is an issue with your RabbitMQ volume, you can clear the volume with the following commands:

```
docker service rm iservices_rabbitmq
docker volume rm iservices_rabbitdb
```

If you get a message stating that the volume is in use, run the following command:

```
docker rm <id of container using volume>
```

Re-deploy PowerFlow by running the following command:

```
docker stack deploy -c /opt/iservices/scripts/docker-compose.yml iservices
```

**NOTE:** Restarting Docker does not clear the queue, because the queue is persistent. However, clearing the queue with the commands above might result in data loss due to the tasks being removed from the queue.

## Viewing the Process Status of All Services

Run the following command:

```
docker ps
```

## Deploying Services from a Defined Docker Compose File

Run the following command:

```
docker stack deploy -c <compose-file> iservices
```

## Dynamically Scaling for More Workers

Run the following command:

```
docker service scale iservices_steprunner=10
```

## Completely Removing Services from Running

Run the following command:

```
docker stack rm iservices
```

## Diagnosis Tools

Multiple diagnosis tools exist to assist in troubleshooting issues with the PowerFlow platform:

- **Docker PowerPack.** This PowerPack monitors your Linux-based PowerFlow server with SSH (the PowerFlow ISO is built on top of an Oracle Linux Operating System). This PowerPack provides key performance indicators about how your PowerFlow server is performing. For more information on the Docker PowerPack and other PowerPacks that you can use to monitor PowerFlow, see the "Using SL1 to Monitor SL1 PowerFlow" chapter in the *SL1 PowerFlow Platform* manual.
- **Flower.** This web interface tool can be found at the /flower endpoint. It provides a dashboard displaying the number of tasks in various states as well as an overview of the state of each worker. This tool shows the current number of active, processed, failed, succeeded, and retried tasks on the PowerFlow platform. This tool also shows detailed information about each of the tasks that have been executed on the platform. This data includes the UUID, the state, the arguments that were passed to it, as well as the worker and the time of execution. Flower also provides a performance chart that shows the number of tasks running on each individual worker.
- **Debug Mode.** All applications can be run in "debug" mode via the PowerFlow API. Running applications in debug mode may slow down the platform, but they will result in much more detailed logging information that is helpful for troubleshooting issues. For more information on running applications in Debug Mode, see [Retrieving Additional Debug Information](#).
- **Application Logs.** All applications generate a log file specific to that application. These log files can be found at `/var/log/iservices` and each log file will match the ID of the application. These log files combine all the log messages of all previous runs of an application up to a certain point. These log files roll over and will get auto-cleared after a certain point.
- **Step Logs.** Step logs display the log output for a specific step in the application. These step logs can be accessed via the PowerFlow user interface by clicking on a step in an application and bringing up the **Step Log** tab. These step logs display just the log output for the latest run of that step.
- **Service Logs.** Each Docker service has its own log. These can be accessed via SSH by running the following command:

```
docker service logs -f <service_name>
```

## Retrieving Additional Debug Information (Debug Mode)

The logs in PowerFlow use the following **loglevel** settings, from most verbose to least verbose:

- **10.** Debug Mode.
- **20.** Informational.
- **30.** Warning. This is the default settings if you do not specify a loglevel.
- **40.** Error.

**WARNING:** If you run applications with "loglevel": 10, those applications will take longer to run because of increased I/O requirements. Enabling debug logging using the following process is the only recommended method. ScienceLogic does not recommend setting "loglevel": 10 for the whole stack with the docker-compose file.

To run an application in Debug Mode using the PowerFlow user interface:

1. Select the PowerFlow application from the **Applications** page.
2. Hover over the **[Run]**  from and select *Debug Run* from the pop-up menu. PowerFlow executes the application in Debug Mode with a log level of 10.

To run an application in Debug Mode using the API:

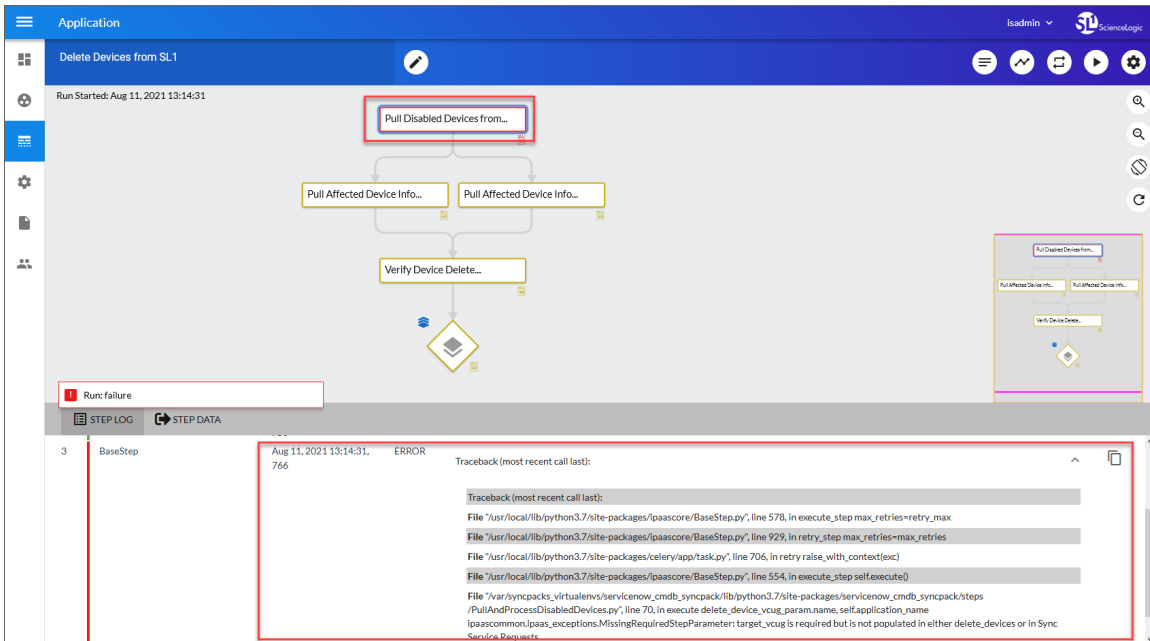

1. POST the following to the API endpoint:

```
https://<PowerFlow>/api/v1/applications/run
```

2. Include the following in the request body:

```
{  
  "name": "<application_name>",  
  "params": {  
    "loglevel": 10  
  }  
}
```

After running the application in Debug Mode, review the step logs in the PowerFlow user interface to see detailed debug output for each step in the application. This information is especially helpful when trying to understand why an application or step failed:

You can also run an application in debug using curl via SSH:

1. SSH to the PowerFlow instance.
2. Run the following command:

```

curl -v -k -u isadmin:em7admin -X POST "https://<your_
hostname>/api/v1/applications/run" -H 'Content-Type: application/json' -H
'cache-control: no-cache' -d '{"name": "interface_sync_sciencelogic_to_
servicenow", "params": {"loglevel": 10}}'

```
