

AP2 Halwa.01 Release Notes

Version 8.16.1.41

SL1 AP2 Halwa.01 version 8.16.1.41 Release Notes

NOTE: The AP2 Halwa.01 version 8.16.1.41 release is a hotfix to the AP2 Halwa version 8.16.1.14. The ".01" in the AP2 release name indicates that it is the first hotfix for the AP2 Halwa release.

The AP2 Halwa.01 version 8.16.1.41 addresses two issues relating to API and Global Manager that affected the AP2 Halwa version 8.16.1.14 release.

IMPORTANT: AP2 releases are separate from SL1 platform releases to provide updates and improvements more frequently.

This release includes the following new features and enhancements:

- [Enhancements to the Timeline panel on the Service Investigator page](#)
- [A new Device Groups widget on the Dashboards page](#)
- [Improved data visibility and management on the Devices page](#)
- [New ways to view and manage events on the Events page](#)
- Plus [several additional new features and enhancements](#)

These release notes provide a comprehensive list of the features, enhancements, and addressed issues that are included in this release.

This document covers the following topics:

Before You Install or Upgrade	3
Installing or Uninstalling AP2 Halwa.01	3
Issues Addressed in AP2 Halwa.01 version 8.16.1.41	8
New Features and Enhancements in AP2 Halwa version 8.16.1.14	8
Issues Addressed in SL1 AP2 Halwa version 8.16.1.14	12
Known Issues	12

Before You Install or Upgrade

Before you install or upgrade to AP2 Halwa.01, ensure you are running one of the following SL1 versions:

- 12.2.3
- 12.3.0, 12.3.1, 12.3.2 and 12.3.3.

IMPORTANT: You do not need to download or install AP2 Halwa.01 if you are on SL1 version 12.3.3 or above, as it is included by default.

NOTE: For details on upgrading SL1, see the appropriate [SL1 platform release notes](#).

IMPORTANT: This update is available to both on-premises and cloud-based (SaaS) SL1 systems. The AP2 Halwa.01 update must be administered to systems that host AP2. All SL1 appliances in your stack must be on the same AP2 version.

Installing or Uninstalling AP2 Halwa.01

To install AP2 Halwa.01 version 8.16.1.41 on to your system, you will need to download and install both the `libem7` and AP2 Halwa.01 RPM files from the [ScienceLogic Support site](#).

IMPORTANT: You do not need to download or install AP2 Halwa.01 if you are on SL1 version 12.3.0 or above, as it is included by default.

NOTE: If you are using an on-premises system, you must install the AP2 and `libem7` RPM files on all appliances, including the Central Database (CDB) and the Administration Portal (AP), if applicable. For AWS Systems, you need to install both RPM files on all relevant data engines (DE).

To install AP2 Halwa.01 version 8.16.1.41:

1. If you have not already done so, install or upgrade your SL1 system to version 12.2.3 or above. For more information about upgrading to those releases, see the appropriate [SL1 platform release notes](#).
 - If you are installing AP2 Halwa.01 version 8.16.1.41 on SL1 versions 12.2.3 or above, skip to step 8.
 - If you have already downloaded and installed the latest `libem7` RPM file from the ScienceLogic Support site, skip to step 8.
 - If you have downloaded the latest `libem7` RPM file from the ScienceLogic Support site, but have not yet installed the file, skip to step 6.
 - If you are unsure where you stand in the download and installation process, proceed to step 2.
2. Either go to the console of the SL1 Database Server or use SSH to access the Database Server. Check to see if you already have the `libem7` RPM file downloaded or installed by running the command `sudo rpm -q libem7-ipcserver`. The correct version should appear as `libem7-ipcserver-0.2.0-2.el8.x86_64.rpm`.
 - If you do not see the correct version, proceed to step 3.
 - If you see the correct version, skip to step 5.
3. Go to the [ScienceLogic Support site](#) and download the `libem7` RPM file locally to your machine from the **AP2 Release Versions** page (Product Downloads > SL1 Platform Downloads > AP2 Releases). To do so, select "libem7" from the **Release Files** table and then click the **[Download File]** button located under the **Release File Downloads** section of the page.
4. Either go to the console of the SL1 Database Server or use SSH to access the Database Server.
 - **For AWS Systems:** At the shell prompt, copy the RPM file to your SL1 system by running the following command:

```
scp -i <aws-system-pem>.pem -o StrictHostKeyChecking=no libem7-ipcserver-0.2.0-2.el8.x86_64.rpm em7admin@<system-ip-address>:/home/em7admin/
```

where:

 - `<aws-system-pem>` is the PEM file for the AWS system.
 - `<system-ip-address>` is the IP address of your SL1 system.
 - **For on-premises systems:** At the shell prompt, copy the RPM file to your SL1 system by running the following command:

```
scp -i -o StrictHostKeyChecking=no libem7-ipcserver-0.2.0-2.el8.x86_64.rpm em7admin@<system-ip-address>:/home/em7admin/
```

where `<system-ip-address>` is the IP address of your SL1 system.
5. If you have the correct version installed, verify if the `libem7` is running properly by running the following command: `sudo systemctl status libem7`.
 - If the status of the `libem7` RPM file displays `active` in the **Active** field, skip to step 8.
 - If you have downloaded the `libem7` RPM file, but it is not showing as active, the `libem7` RPM file has not yet been installed on your device. Proceed to step 6 to install the RPM file.

6. Once you have downloaded the correct `libem7` RPM file, install the file on your device by running the following commands at the shell prompt:

```
sudo dnf install -y libem7-ipcserver-0.2.0-2.el8.x86_64.rpm --  
disablerepo=*
```

```
sudo systemctl enable --now libem7.socket
```

```
sudo systemctl enable --now libem7.service
```

```
sudo systemctl restart libem7.socket
```

```
sudo systemctl restart libem7
```

```
sudo systemctl status libem7
```

7. Verify the status of the `libem7` RPM file displays `active` in the **Active** field by running the following command:

```
sudo systemctl status libem7
```

8. Go to the [ScienceLogic Support site](#) and download the Halwa RPM file locally to your machine from the **AP2 Release Versions** page (Product Downloads > SL1 Platform Downloads > AP2 Releases). To do so, select "Halwa.01" from the **Release Files** table and then click the **[Download File]** button located under the **Release File Downloads** section of the page.

9. Either go to the console of the SL1 Database Server or use SSH to access the Database Server.
 - **For AWS Systems:** At the shell prompt, copy the RPM file to your SL1 system by running the following command:

```
scp -i <aws-system-pem>.pem -o StrictHostKeyChecking=no nextui-<halwa-release-ap2-version>.rpm em7admin@<system-ip-address>:/home/em7admin/
```

where:

- `<aws-system-pem>` is the PEM file for the AWS system.
 - `<halwa-release-ap2-version>` is the AP2 Halwa.01 release version.
 - `<system-ip-address>` is the IP address of your SL1 system.
- **For on-premises systems:** At the shell prompt, copy the RPM file to your SL1 system by running the following command:

```
scp -o StrictHostKeyChecking=no nextui-<halwa-release-ap2-version>.rpm em7admin@<system-ip-address>:/home/em7admin/
```

where:

- `<halwa-release-ap2-version>` is the AP2 Halwa.01 release version.
- `<system-ip-address>` is the IP address of your SL1 system.

10. Install the AP2 RPM file on the Database Servers and the Administration Portal by running the following command on those systems:

```
sudo dnf upgrade -y nextui-<halwa-release-ap2-version>.rpm --disablerepo=*
```

where `<halwa-release-ap2-version>` is the AP2 Halwa.01 release version.

11. Enter `y` to confirm the installation of the AP2 RPM file.
12. Reload the daemon service by running the following command:

```
sudo systemctl daemon-reload
```

13. Restart the NextUI service by running the following command:

```
sudo systemctl restart nextui.service
```

NOTE: AP2 will be inaccessible for a few minutes after restarting the NextUI service.

To uninstall the Halwa.01 release features for AP2 version 8.16.1.41:

1. If you are currently on SL1 12.2.3, and have not previously installed any of the AP2 releases, download the Gelato rollback RPM file from the **AP2 Release Versions** page (Product Downloads > SL1 Platform Downloads > AP2 Releases) on the [ScienceLogic Support site](#). Select "Gelato" from the **Release Files** table and then click the **[Download File]** button located under the **Release File Downloads** section of the page.

NOTE: You can only roll back to an AP2 version that you have previously installed, or if you are currently on an SL1 system running version 12.2.3. If you are on SL1 version 12.3.0 or above, you will not be able to uninstall AP2 version 8.16.1.41, as it is included by default.

2. Once you have the AP2 RPM files downloaded locally, either go to the console of the SL1 Database Server or use SSH to access the Database Server.
 - **For AWS Systems:** At the shell prompt, copy the RPM file to your SL1 system by running the following command:

```
scp -i <aws-system-pem>.pem -o StrictHostKeyChecking=no nextui-<rollback-ap2-version>.rpm em7admin@<system-ip-address>:/home/em7admin/
```

where:

- `<aws-system-pem>` is the PEM file for the AWS system.
 - `<rollback-ap2-version>` is the rollback AP2 version.
 - `<system-ip-address>` is the IP address of your SL1 system.
- **For on-premises systems:** At the shell prompt, copy the RPM file to your SL1 system by running the following command:

```
scp -o StrictHostKeyChecking=no nextui-<rollback-ap2-version>.rpm em7admin@<system-ip-address>:/home/em7admin/
```

where:

- `<rollback-ap2-version>` is the rollback AP2 version.
- `<system-ip-address>` is the IP address of your SL1 system.

3. Install the RPM file on your device by running the following command:

```
sudo rpm -U --force --replacefiles nextui-<rollback-ap2-version>.rpm
```

where `<rollback-ap2-version>` is the rollback AP2 version.

4. Restart the NextUI service by running the following command:

```
sudo systemctl restart nextui.service
```

Issues Addressed in AP2 Halwa.01 version 8.16.1.41

This section describes the issues that were addressed in AP2 Halwa.01 version 8.16.1.41

API

- Resolved an issue where Run-As accounts could be granted incorrect access hooks. (Jira ID: SLUI-21769)

Global Manager

- Resolved an issue in Global Manager where SAML SSO for SL1 authentication was providing users with incorrect permissions, which resulted in increased or reduced access rights. (Case: 00492738) (Jira ID: SLUI-21564)

New Features and Enhancements in AP2 Halwa version 8.16.1.14

The Halwa release for AP2 version 8.16.1.14 includes enhancements to the **Timeline** panel on the **Service Investigator** page, a new **Device Groups** widget for dashboards, improved data visibility and more bulk management options for devices, and greater flexibility when viewing and managing events.

This release includes the following new features and enhancements:

- [Enhancements to the Timeline panel on the Service Investigator page](#)
- [A new Device Groups widget on the Dashboards page](#)
- [Improved data visibility and management on the Devices page](#)
- [New ways to view and manage events on the Events page](#)
- Plus [several additional new features and enhancements](#)

This section describes the features and enhancements that are included in AP2 Halwa version 8.16.1.14.

Business Services

- **What's new: Enhancements to the Timeline panel on the Service Investigator page.** The **Timeline** panel on the **Service Investigator** page has been redesigned. The following updates were made to support this feature enhancement:
 - Added a new **[Skylar AI]** tab to the **Timeline** panel. The **[Skylar AI]** tab includes events that are predicted by Skylar AI, and includes the following fields:
 - **Predictions**, which shows predicted future events in the form of swim lanes that show event processes from start to finish.
 - **Log Insights**, which shows Skylar Automated RCA suggestions and alerts. The alerts are either "Confirmed" or "Suggested". This field was previously the **[Log Insights]** tab.

- **For more information:** See the topic on "Using the Service Investigator" in the **Business Services** manual.

Additional Business Services Updates

- When deleting a service policy on the **[Service Policy]** tab, the **Delete Policy** modal now displays all of the services that are currently using that policy. If the policy is deleted, the associated services will revert to using the default service policy.

Dashboards

- **What's new: A new *Device Groups* widget.** The **Dashboards** page now includes a new **Device Groups** widget, which contains a table with the following columns:
 - **Name.** The name of the device group.
 - **Severity.** The average health value of the devices in the device group. This field is represented by a color-coded "severity" icon that corresponds to a numerical value between 0 and 100.
 - **Device Count.** The number of devices in the device group.

NOTE: You can sort the table by **Name** and **Severity**, but you will not be able to sort the table by **Device Count** until a future AP2 release.

- **What's new: *Improved Dashboard page and widgets.*** Removed the 50 return limit for **Organizations** widgets with the *Table* visualization and added infinite scroll.

NOTE: **Organizations** widgets with *Table* visualizations now displays information in the footer, such as the total, selected, and filtered counts.

Devices

- **What's new: Improved data visibility and management on the Devices page.** You can now perform several bulk actions on selected devices. The following updates were made to support this enhancement:
 - From the **Devices** page, you can now perform several additional bulk actions on selected devices by clicking the **[Actions]** button and selecting one of the following options:
 - *Add to Device Group*
 - *Align SNMP Read Credential*
 - *Change User Maintenance Mode*
 - *Clear Device Logs*
 - On the **Devices** page, added a new **Asset ID** column that displays the ID of any asset associated with a device in the list. The asset ID displays as a hyperlink that you can click to view the asset's properties.
- **For more information:** See the topic on "Using the Device Investigator" in the **Managing Devices** manual.

Events

- **What's new: Improved event management on the Events page.** The **Events** page has new capabilities that provide you with more flexibility when viewing and managing events. The following updates were made to support this enhancement:
 - When you add a new sort to the **Events** page, such as "Message," the selected sort is now the only one applied.
 - You can now revert to the default sort ("Severity" > "Last Detected") by clicking the **[Apply Default Sort]** button from the **Multi Sort** modal.
 - You can now search event notes in both the basic and advanced search on the **Events** page.
 - Added a notification window to the **Events** page that explains the changes to sorting on the page. You can close the notification window, and you can dismiss it permanently by checking the "Don't show this again" checkbox.

GraphQL

- **What's new: An updated GraphiQL browser user interface.** The GraphiQL browser-based user interface has been redesigned to match the SL1 theme. You can also make GraphQL queries or mutations using the GraphQL Yoga engine.

Additional GraphQL Updates

- The SL1 "stack" identification field in GraphQL is now discoverable, which allows Global Manager to more effectively manage stacks.

- Added the "AccessKey" resource to GraphQL. An "AccessKey" will have "AccessKeyHooks" as sub-resources, and both have their own type of Category as sub-resources.
- In Global Manager mode, when making a query to PowerPacks or device categories, a stackDiff will be accessible on any of the fields in that query.
- Added an "id" field to the "Systeminformation" query. The "id" field contains a value that represents the system or stack ID.

NOTE: The system ID is available only on systems running SL1 version 12.3.0 or later.

- In Global Manager mode, the "organizationsByGUID" query now has a stackDiff type that can also be queried.
- Added the following new device-related mutations in GraphQL:
 - "createAssetsForDevices", which allows device assets to be created.
 - "addDevicesToDeviceGroups", which can add one or more devices to a device group.
 - "deleteDeviceLogsByDevice", which clears any logs associated with the specified devices.

Additional New Features and Enhancements for AP2 Halwa version 8.16.1.14

Anomaly Detection

- The **Machine Learning** page was renamed **Anomaly Detection**, and the **Machine Learning Thresholds** page was renamed **Anomaly Detection Thresholds** in the Gelato release for AP2 version 8.14.16. You can now access these pages from the new **Skylar AI** page.

NOTE: To access the **Anomaly Detection** and the **Anomaly Detection Thresholds** pages, go to the **Skylar AI** page in SL1 and click the corresponding button.

Credentials

- When creating a new credential, a search box now displays a list of credential types organized by *Core Credentials* and *Universal Credentials*.
 - "Core Credentials" are credential types without a subtype, and can be configured to monitor most device types and use generic field labels.
 - "Universal Credentials" are credentials with a subtype, and are tailored to monitoring specific types of devices by using field names that correspond to the terminology used and structures of data needed for those technologies.

NOTE: Subtype refers to the subtype for vendor-specific credentials. Possible subtypes are Aliyun, AWS, Azure, Citrix Xen, IBM, and VMware.

Global Manager

- The single sign-on (SSO) configuration process is now the default configuration for all Global Manager systems.
- **For more information:** See the topic on "Configuring a Global Manager System" in the **SL1 Global Manager** manual.

Issues Addressed in SL1 AP2 Halwa version 8.16.1.14

This section describes the issues that were addressed in AP2 Halwa version 8.16.1.14.

Devices

- Addressed an issue that caused several device-related GraphQL fields to always be null, which was resulting in a mismatch in the device data that displayed in the default SL1 user interface (AP2) compared to what displayed in the classic SL1 user interface. (Case: 00461621) (Jira ID: SLUI-20515)

Events

- Addressed an issue that caused the **Events** page to only show critical events upon first loading the page. (Case: 00438166) (Jira ID: SLUI-19966)
- Addressed an issue with the **Events** page that prevented events from properly filtering when using the "Age" filter. (Case: 00437993) (Jira ID: SLUI-19985)

Known Issues

The following known issues affect version both AP2 Halwa.01 version 8.16.1.41 and AP2 Halwa version 8.16.1.14:

- When adding a collector group from the **Collector Groups** page (Manage > Collector Groups), and toggling off **All current and future organizations** from the **Add Collector Group** modal, you will only be able to add up to 10 organizations from the **Limit access to specific organizations** field. To work around this issue, you can add more than 10 organizations to a collector group from the **Collector Group Management** page (System > Settings > Collector Groups) in the classic SL1 user interface. (Jira ID: SLUI-20816)
- The **Device Categories** page (Devices > Device Categories) fails to load properly whenever there is a category with a null ID. To work around this issue, go to the **Device Categories** page (System > Customize > Device Categories) in the classic SL1 user interface, locate the category with the null ID, and then remove that category by clicking the delete icon () next to the category. (Jira ID: SLUI-20731)
- On the **Devices** page, the *Clear Filters* option does not remove search filters from the **Asset ID** column and does not update whenever the page is reloaded. To work around this issue, click the **Select columns** icon () on the **Devices** page, select *Column Preferences*, and then click "Show All". Once you have done so, you can click the **Select columns** icon again and then select *Clear Filters* from the drop-down menu. (Jira ID: SLUI-20779)
- The number of unacknowledged events in the **Device Overview** panel of the **Device Investigator** page does not update despite acknowledging alerts on a device. To work around this issue, add a new "unackEvents" subquery to the "Device Insights" query, then use that subquery to collect and retrieve information on unacknowledged events. (Case: 00471966) (Jira ID: SLUI-20858)
- The **Classic Maps** page fails to load properly whenever you attempt to log in to AP2 without accepting the End-User License Agreement (EULA). To work around this issue, create a Grant All user account, then sign into AP2 with the newly created account. Once you have successfully logged in, go to the **Classic Maps** page (Maps > Classic Maps). (Jira ID: SLUI-20801)
- When clicking on a device group name in the **Device Group** widget on the **Dashboards** page, the **Device Group Editor** modal that opens does not show any information about the selected device group. (Jira ID: SLUI-20703)
- On the **Dashboards** page, the **Device Class** table column in Device widgets using the *Leaderboard* visualization option, will not display any information if *CPU* or *Memory* is an added metric. (Jira ID: SLUI-20627)
- The heat map does not display for **Device** widgets using the *Leaderboard* visualization option, with *CPU* or *Memory* as an added metric, despite selecting "heat" as the display type. (Jira ID: SLUI-20627)
- On the **Events** page, the **Organization** table column cannot be sorted by ascending or descending order. (Jira ID: SLUI-20903)
- Due to an issue with Aurora 3, you can no longer enable TLS verification in SL1 version 12.3.0 through the user interface or API. To address this issue, update the "master.system_settings_general" database table by setting `value=1` where `param='require_tls_verification'`; . ScienceLogic is working to correct this known issue by the next AP2 release, Ice Pop. (Jira ID: SLS-1500)
- Organizations must have one or more accounts assigned to them to ensure the relevant services are saved. (Jira ID: SLUI-17810)
- For services where the **RCA Options** field is enabled and a child service has been removed, SL1 will not compute the health, availability, and risk values until the Service Topology Engine returns an updated topology, which occurs every 5 minutes by default. (Jira ID: SLUI-18853)

IMPORTANT: Before deleting child services in a 3-tier hierarchy, check to see if the parent service has the **RCA Options** field *Enabled*, then set this field to *Disabled* if it is not already.

- When creating a template from a Business Service, you might receive an error if the number of constituents and maximum constituents are greater than the maximum number of policies, which has a default value of 100. To work around this issue, you must increase the maximum number of policies using a GraphQL mutation, replacing `<increased value>` with a larger numerical value such as "1000": (Jira ID: SLUI-19654)

```
mutation updateMaxValue{
  updateFeatureToggle(id: "system:BUSINESS_SERVICES_MAX_POLICIES",
    value: "<increased value>") {
    id
    value
  }
}
```
